## Keyword List

- <sup>1</sup> Architecture, Protocol, Implementation, API, Security, Trust, Privacy

2

## 3 Protocols and Concrete Architecture Executive Summary

4 This document specifies a set of protocol level interoperability profiles, usually leveraging open stan-  
5 dards, deployment scenarios, APIs, and other considerations that constitute the official way to deploy  
6 version 1 of TAS<sup>3</sup> architecture, see [[TAS3ARCH](#)]. The purpose of defining these specifics is to enable  
7 multiple independent implementations of TAS<sup>3</sup> to be wire protocol interoperable (and to limited extent  
8 also API interoperable). TAS<sup>3</sup> reference implementation and reference deployment will behave essen-  
9 tially as described in this document.

10 The TAS<sup>3</sup> architecture is designed to be standards, protocol, data and application agnostic so that any  
11 protocol capable of implementing the flows and satisfying the service requirements can potentially be  
12 used by any application. However, to build practical systems, different components, possibly from differ-  
13 ent sources, must speak the same protocols, hence TAS<sup>3</sup> provides this profile that allows interoperability at  
14 the level of Single Sign-On, Web Service Discovery, Web Service Call, and Authorization. The standard-  
15 ized profile provides the scaffolding where plurality of trust and privacy negotiation mechanisms, policy  
16 languages, obligations and other value added features can exist.

17 The TAS<sup>3</sup> API is designed to allow an application programmer to understand how simple it is to "TAS<sup>3</sup>  
18 enable" his application. It is noteworthy that using the API does not require any in-depth knowledge of  
19 the underlying standards, protocols, and profiles, or indeed even of the TAS<sup>3</sup> Architecture itself. All these  
20 details are taken care of by the API implementation, supplied commercially or in open source. The TAS<sup>3</sup>  
21 Reference Implementation will be one such API implementation. The APIs will be available in all popular  
22 programming languages and platforms.

23 The simplicity of the API is due to a coherent integration model that shows how the steps from SSO and  
24 Authorization all the way to the web service calls work together and are able to pass necessary credentials  
25 and tokens "behind the scenes" by the use of session and other state information. Many design parameters  
26 that could have been handled by yet another argument to the API functions, are in fact handled by con-  
27 figuration file, with sensible default values, and automated discovery, trust negotiation, and trust network  
28 business processes.

29 The split between explicit arguments, configurability, and automated processes has been guided by  
30 division of concerns between the application programmer and the systems administrator. When automatic  
31 mechanisms are used, appropriate manual control point exists elsewhere in the architecture, e.g. automated  
32 discovery is kept in check with explicit authorization.

33 We provide guidance regarding possible integration and deployment scenarios and illustrate how TAS<sup>3</sup>  
34 Architecture can be deployed in a resilient and redundant way.

35 Neither this document nor the TAS<sup>3</sup> Architecture [[TAS3ARCH](#)] mandate use of a particular deployment  
36 or software architecture (although the integration scenarios suggest a recommended one), implementers  
37 are free to organize their software and deployment in other ways as long as the wire protocol compati-  
38 bility is maintained and all signature generation and validation steps, as well as trust determinations, and  
39 authorizations are implemented.

40 The Annex gives some example protocol messages.

41

# 1 Introduction

42

43 This document describes the TAS<sup>3</sup> Concrete Architecture and protocol choices in a normative and pre-  
 44 scriptive way. It also describes the official, but not exclusive, TAS<sup>3</sup> API generically and for selected pro-  
 45 gramming language bindings. Any implementation or deployment claiming "TAS<sup>3</sup>" compliance MUST  
 46 abide by this document as well as [TAS3ARCH], and [TAS3COMPLIANCE]. A deployment usually has  
 47 to satisfy, as well, requirements of the Trust Operator's, see [TAS3GLOS], Governance Agreement and  
 48 certification procedures, some of which concern the software implementation and others the deployment's  
 49 organizational properties. Use of TAS<sup>3</sup> brand is governed by a separate TAS<sup>3</sup> Brand Agreement.

50 This document uses the keywords (e.g. MUST, SHOULD) of [RFC2119]. All text is normative unless  
 51 expressly identified as non-normative. Prose and specification has precedence over examples. In general  
 52 the examples should not be assumed normative unless no normative specification for the subject matter is  
 53 available.

54 This architecture, and related documents are copyrighted works of TAS3 Consortium, as dated. All  
 55 Rights Reserved. This architecture, and related documents, are versioned and subject to change without  
 56 notice. No warranty or guarantee is given. This architecture, and related specifications can be implemented  
 57 on Royalty Free terms by anyone. However, no warranty regarding IPR infringement is given. For further  
 58 details, please see [TAS3CONSOAGMT].

## 1.1 Standardized Wire Protocol Interfaces

60

61 TAS<sup>3</sup> emphasizes wire protocol interoperability in following key areas

- 62 1. Single Sign-On (SSO) and Single Logout (SLO)
- 63 2. Authorization request-response
- 64 3. ID Mapping and Discovery
- 65 4. Web service call
- 66 5. Audit bus reporting and audit trail querying
- 67 6. Delegation
- 68 7. Metadata, registrations, declarations of attribute needs, declarations of attribute availability

69 In some areas TAS<sup>3</sup> recognizes interoperability need, but leaves it up to the business processes, adaptive  
 70 techniques, and involved parties to agree specific means. These include

- 71 ● Policy and obligations languages and vocabularies (although we suggest XACML and SOL1, see  
 72 section 2.10, as one alternative, supported by the reference implementation)
- 73 ● Trust and Privacy Negotiation protocol and metrics or scores (although we suggest TrustBuilder and  
 74 some XACML extensions, see section 2.6)
- 75 ● Application ("payload") protocols and data formats
- 76 ● Format of the local audit trail
- 77 ● Business Process Modelling techniques and languages

78 TAS<sup>3</sup> recognizes the usefulness of a consistent user experience, e.g. in Dashboard, SSO, consent, trust  
 79 and privacy negotiation, policy editing, etc., but this document does not attempt to prescribe these aspects.

80

## 81 1.2 Composition and Co-location of Architectural Components

82 When implementing practical systems, it often turns out that many of the architecturally designed  
 83 boxes are in fact implementable by one software module. For example, with reference to Fig-2.3 of  
 84 [TAS3ARCH], it is clear that a software module called "Service Requester" may exist, realizing Rq-  
 85 PEP-Out, Rq-PEP-In, and Stack components all together without them being necessarily separable. Such  
 86 composition does not harm interoperability as those submodules of Service Requester were always meant  
 87 to be part of the same process and to communicate via function call interfaces. Indeed, the official TAS<sup>3</sup>  
 88 API, see section 3, lumps all these in one function call: *tas3\_call()*. However all external interfaces from  
 89 *tas3\_call()*, such as authorization, discovery, and web service call, do speak standard protocols as profiled  
 90 in this document.

91 It is ok for an implementation to compose, as an optimization, components that were meant to be wire  
 92 protocol interfaces (see section 1.1), e.g. reach authorization by function call interface instead of XACML,  
 93 as long as the implementation makes the same interface available over-the-wire by a mere configuration  
 94 change (no recompile required/allowed).

95 From protocol perspective *co-location* of services (having two distinct service processes running on the  
 96 same server hardware, or even running as separate processes under the same web server) does not present  
 97 any problem, save for the complications of using nonstandard TCP/IP ports or requirement of configuring  
 98 multiple IP addresses to same host.

99 From risk management and excessive visibility, or fat target, perspective, see *T161-Panopticon* threat  
 100 in [TAS3COMPLIANCE], some services clearly should not be co-located. Division of responsibilities  
 101 becomes important here and any two roles played by one system entity where they are co-located must  
 102 not have a conflict of interest. In particular, the following are incompatible for co-location

- 103 ● anything vs. Audit
- 104 ● SP vs. IdP (some exceptions apply)
- 105 ● SP vs. ID Mapping and Discovery
- 106 ● SP vs. Delegation
- 107 ● IdP vs. Authorization (some exceptions apply)

108 Some services can be safely co-located, and often are:

- 109 ● IdP often includes Attribute Authority, ID Mapping, Discovery, and fat client Authentication Ser-  
 110 vice. Although an IdP should not pretend to be a Policy Enforcement Point, it is clear that an IdP  
 111 can exert such control by refusing to issue tokens that are necessary for functioning of the rest of  
 112 the architecture.
- 113 ● SP and PEP are natural partners, indeed different facets of the same process

## 115 2 Protocols and Profiles

116 To complement the specification of protocols here, the reader may want to consult Fig-8.18 in [HafnerBreu09]  
117 for an overview of the functionality available in various specifications.

118 The choice of protocols has been guided by commitment to open standards as recommended in section  
119 2 of [UNDP07]. This also serves to address Reqs. *D1.2-2.4-MultiVendor*, *D1.2-2.5-Platform*, and *D1.2-*  
120 *2.6-Lang*.

### 122 2.1 Supported Authentication and Login Systems

123 This section addresses Reqs. *D1.2-2.18-AnCredi*, *D1.2-6.12-Sec*, *D1.2-7.3-An*, and, *D1.2-7.10-Target*.

#### 125 2.1.1 System Entity Authentication

126 TAS<sup>3</sup> adopts X.509v3 public key certificates as primary means of authenticating system entities. This  
127 will apply over TLS and ClientTLS connections and may also apply in digital signatures.

128 For bilateral authentication Client TLS MUST be supported. HTTP Basic authentication MAY be  
129 supported.

#### 131 2.1.2 SAML

132 Given the already broad adoption of SAML 2.0 by the eGovernment and academic commu-  
133 nities across the world (e.g. DK, NZ, FI, etc.), this choice is effectively already made for us.  
134 By choosing SAML 2.0 we enable many existing eGovernment and academic projects easily  
135 to become TAS<sup>3</sup> compliant in future.

- 136 1. TAS<sup>3</sup> adopts SAML 2.0 Assertions, see [SAML2core], as primary and recommended token format.  
137 Alternatives such as SAML 1.1 or Simple Web Token (SWT) [Hardt09] were considered either obsolete  
138 or not yet mature. In future we may consider supporting SWT and X509 attribute certificates as token  
139 format. This will become especially relevant when architecture is extended to support RESTful services  
140 approaches.
- 141 2. TAS<sup>3</sup> adopts SAML 2.0 as primary and RECOMMENDED SSO system, see [SAML2core]. (Req.  
142 *D1.2-3.10-JITPerm*)
- 143 3. TAS<sup>3</sup> RECOMMENDS that SAML 2.0 implementations are Liberty Alliance Certified.
- 144 4. SAML 1.0, 1.1 [SAML1core], 1.2, as well as Liberty ID-FF 1.2 [IDFF12] MAY be supported
- 145 5. Redirect - POST SSO profile MUST be supported by all front channel participants, see [SAML2prof]  
146 and [SAML2bind].
- 147 6. Redirect - Artifact - SOAP SSO profile MUST be supported in IdP and SHOULD be supported in Front  
148 End (SP), see [SAML2prof] and [SAML2bind].
- 149 7. Redirect Single Logout Profile MUST be supported, see [SAML2prof] and [SAML2bind].
- 150 8. IdP Extended Profile, see [SAML2conf], namely IdP Proxying, MUST be supported
- 151 9. Other SAML profiles MAY be supported
- 152 10. SAML metadata MUST be supported, see [SAML2meta]
- 153 11. Well Known Location (WKL) method of metadata publishing MUST be supported, see [SAML2meta]  
154 section 4.1 "Publication and Resolution via Well-Known Location", p.29, for normative description of  
155 this method. Support for WKL method for metadata acquisition is RECOMMENDED.

156 N.B. Publishing metadata using WKL at its most basic form is as simple as placing a hand  
 157 edited metadata file in the web root at the place referenced by the EntityID of the site.  
 158 Many software packages handle this automatically and may even generate the metadata  
 159 dynamically, on the fly.

160 12. In redirect binding [[RFC1951](#)] deflate compression MUST be used. [[RFC1952](#)] format MUST NOT  
 161 be used.  
 162

### 163 2.1.2.1 Authentication Request

- 164 1. MUST use `NameIDPolicy/@Format` of Persistent ("urn:oasis:names:tc:SAML:2.0:nameid-format:persistent")  
 165 when implementing Pull Model (Req. *DI.2-7.8-NoColl*).
- 166 2. MUST use `NameIDPolicy/@Format` of Transient ("urn:oasis:names:tc:SAML:2.0:nameid-format:transient")  
 167 when implementing Linking Service model.
- 168 3. MUST set `NameIDPolicy/@SPNameQualifier`
- 169 4. MUST set `NameIDPolicy/@AllowCreate` flag at all times true
- 170 5. SHOULD not set `IsPassive` flag (in some cases there may be justified reasons to do otherwise)
- 171 6. MUST use `AssertionConsumerServiceIndex`
- 172 7. MUST NOT use `ProtocolBinding` or `AssertionConsumerServiceURL`
- 173 8. Step-up authentication, using Authentication Context Class References MUST be supported.
- 174 9. SHOULD use `AttributeConsumingServiceIndex` attribute, which refers to a section of the meta-  
 175 data, as way of selecting the attributes that are returned in the authentication response. Reader should  
 176 be aware that new proposals for solving this issue more dynamically have been submitted to OASIS  
 177 Security Services Technical Committee, e.g. [[Kellomaki08](#)]. It should also be noted that the returned  
 178 attributes are always at discretion of the IdP.  
 179

### 180 2.1.2.2 Authentication Response

181 The authentication request will be responded with an assertion that satisfies following:

- 182 1. MUST contain `<sa:AuthnStatement>`
- 183 2. MUST specify the Level of Authentication as `AuthnStatement/AuthnContext/AuthnContextClassRef`.
- 184 3. MUST use the LoA profile [[SAML2LOA](#)] to return LoA to the SP.
- 185 4. SHOULD have `AudienceRestriction/Audience` element referencing the SP.
- 186 5. MAY contain `<AttributeStatement>` detailing user's attributes as relevant to SP and/or requested  
 187 using `AttributeConsumingServiceIndex`.
- 188 6. SHOULD have an `<AttributeStatement>` containing a discovery bootstrap (attribute named "urn:liberty:disco:2006-  
 189 08:DiscoveryEPR" whose value is an endpoint reference) as described in [[Disco2](#)] section 4 "Discovery  
 190 Service ID-WSF EPR conveyed via a Security Token".
- 191 7. MAY have additional Attribute Statements conveying other endpoint references. Rather than providing  
 192 additional EPRs at SSO, using discovery is RECOMMENDED. If additional EPRs are passed, the  
 193 attributes SHOULD be named "urn:liberty:disco:2006-08:DiscoveryEPR" even if they do not refer  
 194 to discovery service. The SP, when seeing "urn:liberty:disco:2006-08:DiscoveryEPR" attribute MUST  
 195 look at the `Attribute/AttributeValue/EndpointReference/Metadata/ServiceType` element to  
 196 determine the type of the end point reference. The SP SHOULD consider any attribute whose value is  
 197 an `<a:EndpointReference>` to be a bootstrap.

198

### 199 2.1.3 Shibboleth

200 Shibboleth MAY be supported. Shibboleth based on SAML 2.0 is RECOMMENDED. Supporting  
 201 Shibboleth enables higher education institutions to adopt TAS<sup>3</sup> with minimal reconfiguration and rein-  
 202 vestment.

203 Shibboleth does not currently (2009) support Single Logout. As a condition of TAS<sup>3</sup> compliance, such  
 204 support should be added (please contribute any such work to the Shibboleth open source implementation  
 205 so that this caveat can be deleted). However, a TAS<sup>3</sup> compliant Trust Network may waive this requirement  
 206 after analysis of the impact and a pondered decision (i.e. its easier to implement it than to get lawyers to  
 207 agree).

208 Shibboleth does not officially support Well Known Location method of metadata publication, but any  
 209 Shibboleth deployment can satisfy this requirement by simply hand crafting a metadata file and making it  
 210 available on their web server at the EntityID URL.

211 We have not fully validated all use cases with Shibboleth. Specific points of contention include lack of  
 212 full user identification, e.g. statement that User is a student or staff member of university, without giving  
 213 out a persistent pseudonym. While a valid approach that better protects the user's privacy than the use of  
 214 a persistent ID, it may not be able to address all the use cases, especially in the commercial world where  
 215 service providers wish to link a user's requests together.

### 217 2.1.4 eID and Other Smart Cards

218 European eID cards and other smart cards are supported as an authentication method available at SAML  
 219 2.0 IdP.

### 221 2.1.5 One-Time-Password Tokens

222 One-Time-Password Tokens, such as RSA Tokens or Yubikey, are supported as an authentication meth-  
 223 ods available at SAML 2.0 IdP.

### 225 2.1.6 OpenID

226 OpenID [[OpenID](#)] MAY be supported. If supported, OpenID 2.0 MUST be used as earlier versions  
 227 have known security flaws.

228 It should be noted that OpenID's globally unique identifier model does not provide privacy protection.

229 We have not validated whether it is possible to implement TAS<sup>3</sup> architecture using OpenID. One specific  
 230 point of uncertainty is passing the IM bootstrap token at SSO time. No native OpenID mechanism is  
 231 known to exist (standardized; ad-hoc approaches are known). One suggestion, applicable to the RESTful  
 232 binding would be to use OAUTH.

### 234 2.1.7 CardSpace / InfoCard and WS-Federation

235 Card Space MAY be supported. If supported, at least SAML 2.0 token format MUST be supported.  
 236 The token MUST also support passing IM / Discovery bootstrap token.

### 238 2.1.8 CA / Netegrity Siteminder Proprietary SSO

239 Siteminder MAY be supported. However, we have not validated whether it is possible to implement  
 240 TAS<sup>3</sup> architecture using Siteminder. Prospects do not look particularly good as the Siteminder protocol  
 241 and product can not easily be configured to convey the IM bootstrap token. However, the same vendor  
 242 sells a SAML2 solution, so ask for that instead.

- 243 • Not standards compliant, but by far the most relevant player on the market

244

### 2.1.9 Citrix, Sun, and other proprietary SSO

MAY be supported. However, we have not validated whether it is possible to implement TAS<sup>3</sup> architecture using these.

### 2.1.10 Web Local Login

We have not validated whether it is possible to implement TAS<sup>3</sup> architecture using local login approach. The local login approach has many problems, including

- Each site has separate login so more burden to the user
- Users are lazy and use same password on many sites, thus allowing the sites to impersonate (masquerade) their users towards other sites.
- Local logins require local effort to support new better authentication methods.
- Local logins necessitate local user database maintenance
- Local logins require password resets to be handled locally

If you must do local login, we recommend using one-time-passwords and the Authentication Service Protocol [[SOAPAuthn2](#)] to validate the authentication centrally using an IdP.

### 2.1.11 Desktop Login

We have not validated whether it is possible to implement TAS<sup>3</sup> architecture using desktop login approach. We recommend using one-time-passwords and the Authentication Service Protocol [[SOAPAuthn2](#)] to validate the authentication centrally using an IdP.

- Terminal servers: Mind-The-Box, Citrix, Windows TS, etc.
- Active Directory PDC

A backup plan would be to capture the authentication at LDAP or Active Directory level and make the Authentication Service call from this middleware.

The Desktop login approach suffers from similar security problems as the Fat Client Login, which see below.

### 2.1.12 Fat Client Login

"Fat Client" refers to any non web browser client, e.g. email reading program (as opposed to web mail) or GUI form filling application (as opposed to web GUI). Fat Client scenario often arises with embedded systems, such as medical devices that need to talk to TAS<sup>3</sup> network.

The main security problem in Fat Client Login is that the fat client itself becomes an intermediary to the authentication process, handling sensitive credentials. Some notion of Trusted Computing Path may help to address verifying that the fat client is not compromised.

We recommend using one-time-passwords and the Authentication Service Protocol [[SOAPAuthn2](#)] to validate the authentication centrally using an IdP. One-time-passwords effectively solve the intermediary problem.

If Fat Client Login is a requirement, Liberty Advanced Client approach, see [[AdvClient](#)] and [[SOAPAuthn2](#)], SHOULD be used.

284

### 285 2.1.13 User Not Present or Batch Operations

286 TAS<sup>3</sup> specifies some approaches for doing this, see [TAS3D4IID], mainly based on using advanced au-  
 287 thorization to obtain discovery token without authenticating the User. Liberty Advanced Client approach,  
 288 see [AdvClient] and [SOAPAuthn2], SHOULD be used.

## 290 2.2 Supported Identity Web Services Systems

291 The web services must satisfy some technical requirements

- 292 ● Messages MUST be correlated, so each response is bound to request in an auditable way
  - 293 - Message ID correlation
  - 294 - Business Process Model and Instance IDs (or context or instance) to allow overarching correla-  
 295 tion of several request-response pairs (e.g. to avoid actors who would have conflicts of interest  
 296 overall that might not be identified when only working at level of individual request-response  
 297 pairs)
    - 298 - PDP can receive this easy enough as an environment parameter and this is needed to  
 299 support dynamic separation of duties
    - 300 - Gap: business process modelling does not express this?
    - 301 - Consider URL format hierarchical ID
    - 302 - Better typed, like LDAP DN format, or query string
- 303 ● Requester and Responder MUST be identified (Req 10.4)
- 304 ● Synchronous web service calls MUST be supported
- 305 ● Asynchronous calls SHOULD be supported where needed. Business Process Engines will handle  
 306 asynchrony.
- 307 ● Subscribe - Notify mechanism SHOULD be supported where needed
  - 308 - subscription for events will be vital to pick up errors and notify of events like break the glass
  - 309 - subscribe and publish ws-eventing
  - 310 - Event bus as a subscribe and publish mechanism
- 311 ● Maximum availability and use digital signature and encryption technologies, i.e. technical solutions  
 312 to security and trust problems.

313

### 314 2.2.1 Framework

- 315 1. MUST support SOAP 1.2
- 316 2. MUST support XML-DSIG [XMLDSIG], a.k.a. RFC3275. In future we may introduce simpler  
 317 schemes like Simple Web Token [Hardt09]. Using TLS connection stream as an audit trail element  
 318 is impractical due to volume and inability of implementations to capture it. TLS stream as audit trail  
 319 may also lead to inadvertent collateral disclosure.
- 320 3. MUST support Exclusive XML Canonicalization [XML-EXC-C14N] for purposed of [XMLDSIG].
- 321 4. MAY support simple sign [SAML2SimpleSign]. In future we will support Simple Web Token [Hardt09]  
 322 which is very similar to simple sign.

323 5. MUST support XML-Enc [XMLENC] for protection of NameIDs and attributes, including bootstraps,  
 324 as well as assertions, against an active intermediary. The common case in question is a SP that is about  
 325 to make a web service call. To make such call, the SP must obtain from the discovery service a token  
 326 that is passed to the web service provider. XML-Enc support allows the discovery service to pass in the  
 327 encrypted token the pseudonym, and potentially some sensitive attributes, to the web service provider  
 328 without the intermediary, SP in this case, being able to snoop on this confidential information. This  
 329 case can not be solved using TLS alone as TLS is point-to-point and for this case TAS<sup>3</sup> architecture  
 330 necessarily specifies an active intermediary.  
 331

### 332 2.2.2 Liberty ID-WSF

- 333 1. MUST support ID-WSF 2.0 [SOAPBinding2]  
 334 2. MAY support ID-WSF 1.2  
 335 3. An implementation MUST support the following sec mechs, see [SecMech2]:  
 336 - "urn:liberty:security:2005-02:TLS:Bearer"  
 337 - "urn:liberty:security:2006-08:TLS:SAMLV2" (Holder-of-Key, HoK)

338 A deployment MAY, as a configuration option, choose either.

- 339 4. MAY support following sec mechs for testing, but MUST NOT permit their use in production environ-  
 340 ments:  
 341 - "urn:liberty:security:2005-02:null:Bearer"  
 342 - "urn:liberty:security:2006-08:null:SAMLV2" (Holder-of-Key, HoK)  
 343 5. MAY support other TLS [RFC2246] based sec mechs, including ClientTLS.  
 344 6. MUST NOT permit non-TLS sec mechs in production environments  
 345 7. Implementations SHOULD be Liberty Alliance certified, see [IDWSF2SCR].  
 346 8. Implementations MUST support <ProcessingContext> "urn:liberty:sb:2003-08:ProcessingContext:Simulate"  
 347 SOAP header and implement a "dry-run" feature using it. A deployment MAY, as a configuration op-  
 348 tion, enable this feature. Partially satisfies Reqs. *D1.2-12.13-Vfy* and *D1.2-12.16-OnlineTst*.  
 349 9. An implementation MUST support a health check feature. We RECOMMEND that the health check  
 350 uses the "dry-run" feature mentioned in the previous item.  
 351

### 352 2.2.3 Bare WS-Security Header or Simplified ID-WSF

- 353 1. SHOULD NOT use, as many important security features such as message correlation, replay detection,  
 354 and identification of endpoints are not supported by this mechanism.  
 355 2. Document resultant limitations if not implementing full ID-WSF.  
 356

### 357 2.2.4 WS-Trust

- 358 • MAY support [WSTrust] in general, but MUST support if deploying the particular case of accessing  
 359 external Credential Validation Service, per [ChadwickSu09]

360 We have not validated whether it is possible to implement TAS<sup>3</sup> architecture using WS-Trust. Clearly  
 361 WS-Trust can be used as a token exchange protocol, but for this to be interoperable heavy profiling is  
 362 needed. Users and advocates of WS-Trust should undertake to write such profile.

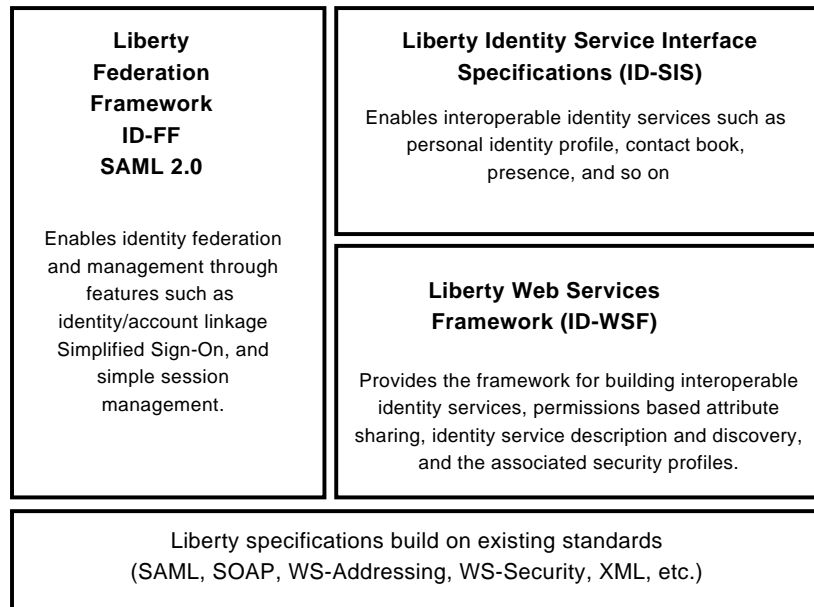

Figure 2.1: Liberty Alliance Architecture.

363

## 364 2.2.5 RESTful Approach

365 MAY support. We RECOMMEND support on basis of OAuth [OAUTH] and OAuth WRAP [Tom09],  
 366 but implementers should take in account security advisories published on [oauth.net](http://oauth.net) web site. OAuth  
 367 WRAP is still immature as of this writing (Nov. 2009) and can not be recommended for production use.

368 We have not validated whether it is possible to implement TAS<sup>3</sup> architecture using RESTful approach.

369 RESTful enablement is nice to have, but should not compromise elegance of the SOAP solution and  
 370 may be less capable (i.e. it is enough that the RESTful approach solves front channel use cases). RESTful  
 371 approach may support more economical token formats such as Simple Web Token (SWT) [Hardt09].

372 TAS<sup>3</sup> project plans to address RESTful binding in future work during 2010.

## 374 2.2.6 Message Bus Approach

375 We see deploying TAS<sup>3</sup> services on message bus architecture as feasible. This will be investigated in a  
 376 future iteration of this deliverable.

## 378 2.3 Authorization Systems

379 This section addresses Reqs. *D1.2-2.19-AzCredi* and *D1.2-2.20-Az*.

380 Authorization systems are extensively covered in [[TAS3D71IdMAnAz](#)].

### 382 2.3.1 Authorization Queries

- 383 1. MUST support XACML 2.0 [[XACML2](#)] request-response contexts for authorization queries
- 384 2. MAY support other versions of XACML
- 385 3. MAY support XACML policy language
- 386 4. MUST support XACML SAML Authorization Query extension [[XACML2SAML](#)] in order to allow  
 387 policies to be dynamically passed to the PDP

388 All communication between the PEP and PDP will be using SOAP based XACML SAML profile. This  
 389 profile is mostly independent of rules language. Thus the PERMIS and trust and reputation language

390 specificity will be mostly contained within the PDPs themselves. The only exception is the obligation  
 391 vocabulary which must be understood by the distributed Obligations Services and therefore needs to be  
 392 standardised. This is a major effort that has already been started in the TAS<sup>3</sup> project. On the other hand,  
 393 the sticky policies, which will be passed over the wire in the protocol exchange, will be engineered such  
 394 that they transparently pass from the data store to the appropriate field of the XACML request without the  
 395 PEP proper really having to understand them.

### 397 2.3.2 Policy Languages

398 TAS<sup>3</sup> does not mandate any specific policy language. However, consider following possibilities:

- 399 1. PDP SHOULD support XACML 2.0 policy language [[XACML2](#)]
- 400 2. PDP MAY support PERMIS 5.0 policy language
- 401 3. PDP MAY support P3P policy language
- 402 4. PDP MAY support PrimeLife privacy policies
- 403 5. PEP, PDP, and Obligations Service MAY support SOL1, see section 2.10, for obligations
- 404 6. CVS MAY support PERMIS Policy CVS Schema (cf. [[TAS3D71IdMAnAz](#)] Appendix 2)

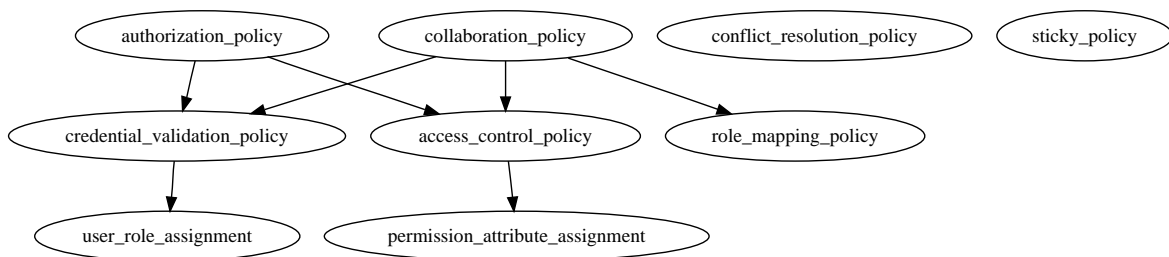

Figure 2.2: Hierarchy of policies

405

## 406 2.4 Trust and Security Vocabularies

407 Usage of ontologies in TAS<sup>3</sup> is thoroughly addressed in [[TAS3D22UPONTO](#)], which will map some of  
 408 these vocabularies.

### 410 2.4.1 Levels of Authentication (LoA)

411 TAS<sup>3</sup> recommends the use of the NIST 4 levels of assurance as described in [[NIST-SP800-63](#)] and  
 412 profiled in [[SAML2LOA](#)].

413 TAS<sup>3</sup> is working on determining whether and how to support LoA schemes of various European coun-  
 414 tries.

### 416 2.4.2 Vocabularies for Authorization

417 Some work has been done in RADIUS [[RFC2138](#)] and Diameter [[RFC3588](#)].

418 [[SAML2context](#)] is mainly about authentication, but authorization is also touched.

419 This section will be expanded in a future version of this document.

### 421 2.4.3 Vocabularies for Basic Attributes (PII)

422 Use of following vocabularies of PII is RECOMMENDED:

- 423 • LDAP inetOrgPerson [[RFC2798](#)]
- 424 • Liberty Personal Profile specification [[IDPP](#)]
- 425 • X.500 standards, such as [[X520](#)] and [[X521](#)]. See also [[RFC2256](#)].

426 This section will be expanded in a future version of this document.

#### 428 2.4.4 Discovery Vocabularies

429 Main vocabulary for discovery is the Service Type taxonomy described in [[Disco2](#)]. This taxonomy is  
 430 complemented by discovery options that further describe the service. This vocabulary SHOULD be used  
 431 when applicable.

432 Each Liberty service specifies its own Service Type value as well as a number discovery options. For  
 433 example, see [[IDDAP](#)], [[IDPP](#)], or [[DST21](#)].

434 This section will be expanded in a future version of this document.

#### 436 2.4.5 Security and Trust Vocabularies

437 See [[SAML2context](#)] and [[SecMech2](#)] for a vocabulary of security mechanisms that MUST be used  
 438 when applicable.

439 This section will be expanded in a future version of this document.

#### 441 2.4.6 Audit Vocabularies

442 Audit events from RADIUS [[RFC2139](#)] and Diameter [[RFC3588](#)] are RECOMMENDED for use where  
 443 applicable.

444 This section will be expanded in a future version of this document. As audit is active research topic, we  
 445 benefit from the research during the TAS<sup>3</sup> project to specify this section in detail in the final version of  
 446 this document.

### 448 2.5 Realization of the Discovery Function

- 449 • MUST support Liberty ID-WSF 2.0 Discovery Service specification [[Disco2](#)]
- 450 • MAY support [[Disco12](#)]
- 451 • MAY support UDDI, however this may require significant extensions to UDDI. Such extensions  
 452 would need to be profiled.

453 See [[NexofRA09](#)], section 5.4 "The Overview-Model", fig 18, for a view of the interaction between  
 454 service registration and service discovery. Unfortunately the referred document fails to recognize the need  
 455 for per-identity service registrations, unless the oblique reference, where no difference is made between  
 456 service requester entity and the data subject, in section 5.4.4 "Service Discovery", counts.

### 458 2.6 Realization of the Trust and Privacy Negotiator Function

459 The protocol to realise the trust negotiation functionality has yet to be finalised. Candidate protocols  
 460 are:

- 461 i. the one used by TrustBuilder 2 [[TrustBuilder2](#)]
- 462 ii. one based on the Web Service Profile of XACML [[Anderson07](#)] as enhanced by [[Mbanaso09](#)]
- 463 iii. one based on an enhanced Liberty Discovery Service [[Disco2](#)]

464 Whichever protocol is finally chosen it must be able to support a ceremony to gaining incremental levels  
 465 of mutual trust. The Web GUI of the Front End MUST support the ceremony.

466 Trust and Policy Negotiation generally takes authentication and identification of all parties for granted,  
 467 but then computes a trust score which typically governs the access control decisions.

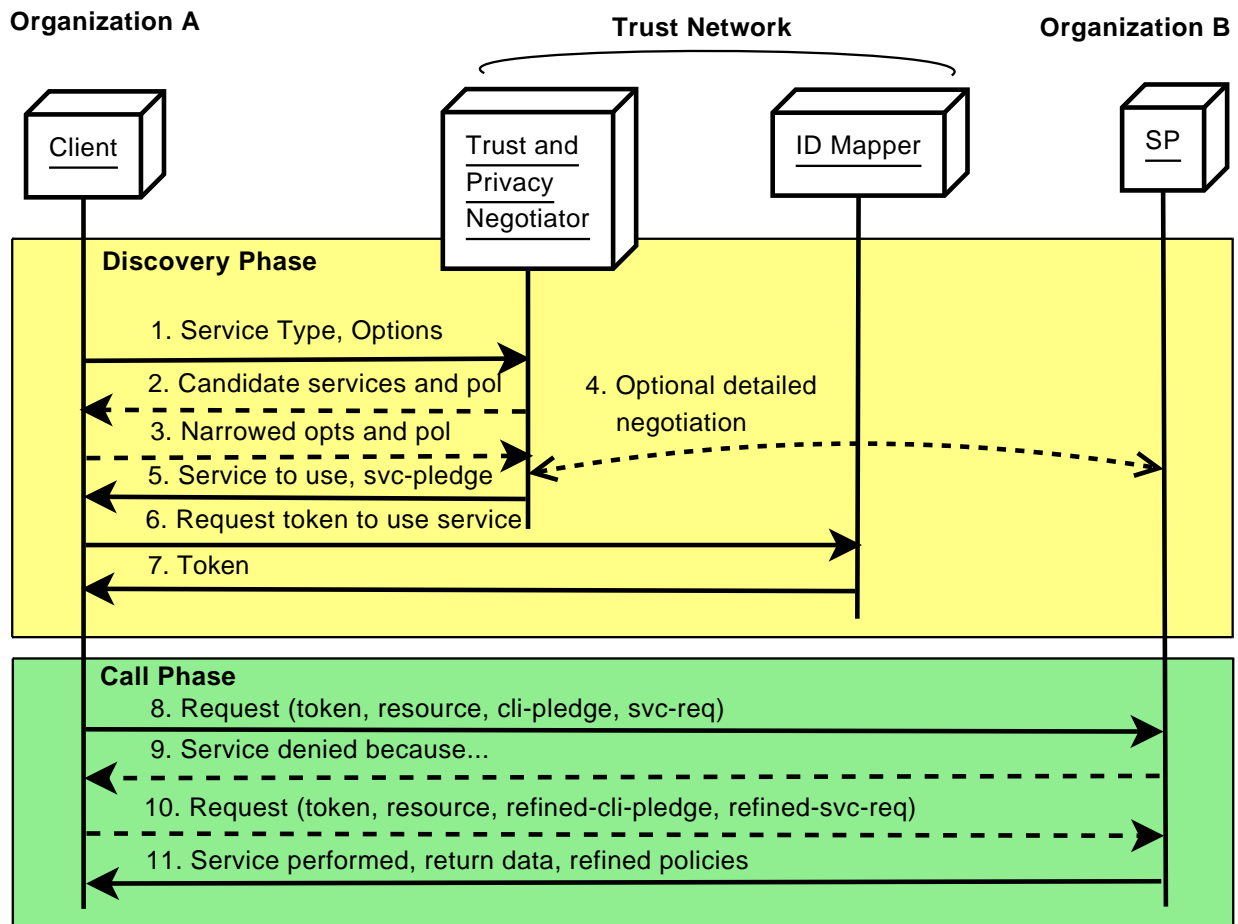

Figure 2.3: Trust and Privacy Negotiation and Discovery steps

468

### 469 2.6.1 Discovery in Trust and Privacy Negotiation

470 In this model both "Trust and Privacy Negotiator" and "ID Mapper" are implemented as parts of Dis-  
472covery Service.

### 473 2.6.2 Frontend Trust and Privacy Negotiation

474 In future work we will address user giving input to Trust and Privacy Negotiation.

## 476 2.7 Realization of the Audit and Dashboard Function

477

### 478 2.7.1 Audit Event Bus

479 Tentative protocol choice (in order of preference):

- 480 1. AMQP [[AMQP06](#)]
- 481 2. Liberty Accounting Service [[AcctSvc](#)] with subscriptions and notifications [[SUBS2](#)] and [[DesignPat](#)].
- 482 3. Diameter [[RFC3588](#)]
- 483 4. RADIUS [[RFC2138](#)]
- 484 5. Apache Muse

Figure 2.4: A deployment architecture for Trust and Privacy Negotiation and Discovery

485 Whichever transport is chosen, the actual audit records are packaged as OpenXDAS messages (see:  
 488 `openxdas.sourceforge.net`).

### 488 2.7.2 Audit Event Ontology

- 489 • Enumeration of mandatory edit events according to some standard
- 490 - RADIUS and Diameter communities have defined at least some messages
- 491 • ZXID logging documentation [[ZXIDREADME](#)] provides an idea, at least applicable to SSO

### 493 2.7.3 Dashboard Function

- 494 • Dashboard should also realize the "PII Consent Service" or "Privacy Manager" at large.
- 495 • SHOULD support Liberty Interaction service [[Interact2](#)]

## 497 2.8 Realization of Delegation Function

498 The Delegation Service functionality is described in section 6 of D7.1. The protocols that this will use  
 499 will be described in the next version of the current deliverable.

## 501 2.9 Attribute Authorities

502 TAS<sup>3</sup> network may contain various attribute authorities. Every Identity Provider may act as an attribute  
 503 authority by including `<AttributeStatement>`, see [[SAML2core](#)], in the single sign-on assertions that  
 504 it emits. This constitutes an attribute push mechanism.

505 Problem with a push mechanism is knowing which attributes to push. A possible solution is for the Front  
 506 End to express its attribute needs using a SAML extension, such as [[Kellomaki08](#)]. However, usually a

507 better solution is to implement pull model Attribute Authority, i.e. the attribute authority is simply a web  
 508 service.

509 There are several ways of implementing a data web service. [SAML2prof] specifies AttributeQuery  
 510 protocol, but does not adequately specify the transport binding and peer authentication. TAS<sup>3</sup> attribute au-  
 511 thority SHOULD support [SAML2prof] AttributeQuery protocol using TAS<sup>3</sup> SOAP binding, see section  
 512 2.2.2.

513 Other data web services, such as ID-DAP [IDDAP] over TAS<sup>3</sup> SOAP binding, MAY be supported. A  
 514 deployment may also make local or proprietary arrangements for accessing a non TAS<sup>3</sup> attribute authority,  
 515 e.g. using LDAP [RFC2251] or WebDAV with file containing attribute certificate or SAML attribute  
 516 assertion.

## 518 2.10 TAS<sup>3</sup> Simple Obligations Language (SOL)

519 TAS<sup>3</sup> Architecture foresees that a Service Requester needs to express obligations and policies that it is  
 520 willing and able to respect, and on the other hand the personal data will have associated with it obligations  
 521 and policies ("sticky policies") under which the data can be released.

522 In general the obligations and sticky policies can be expressed in any convenient language. Unfortu-  
 523 nately no standard language has emerged in the industry for this type of application despite many being  
 524 proposed. TAS<sup>3</sup> is committed to supporting multiple such languages, but for purposes of pilots and other  
 525 simple applications we define "TAS<sup>3</sup> Simple Obligations Language n<sup>o</sup>1" (SOL1) with potential future  
 526 versions to follow.

527 SOL obligations MAY be used in XACML obligations as described in [TAS3D71IdMAnAz]. In partic-  
 528 ular, D7.1 Appendix A1.2 provides an example. In short, they MUST appear in an Obligation/AttributeAssignment  
 529 element. When passed in <b:UsageDirective>, <xa:Obligation> element MUST be used as a wrap-  
 530 per. Use of <xa:Obligation> element as a wrapper in other XML contexts is RECOMMENDED.

531 The urn:tas3:sol:vers Query String parameter allow for versioning of the obligations language.  
 532 The actual obligations are expressed using URL Query String Syntax with attribute value pairs expressing  
 533 the obligations. Newline (0x0a) MAY be used as separator instead of an ampersand. Should escaping be  
 534 needed, the URL encoding MAY be used.

### 535 Example

```
536 <xa:Obligation ObligationID="http://TAS3.eu/TAS3sol/PrivacyPurpose"
537           FulfillOn="Permit">
538   <xa:AttributeAssignment
539     AttributeID="urn:tas3:attribute:obligationDescription"
540     DataType="http://www.w3.org/2001/XMLSchema#string">
541     urn:tas3:sol:vers=1
542     urn:tas3:sol1:delon=1255555377
543     urn:tas3:sol1:use=urn:tas3:sol1:use:purpose
544     urn:tas3:sol1:share=urn:tas3:sol1:share:group
545     urn:tas3:sol1:repose=urn:tas3:sol1:repose:oper
546   </xa:AttributeAssignment>
547 </xa:Obligation>
```

548 As can be seen from the example, the attributes are actually URNs and each attribute tends to express  
 549 an obligation that is required by data or that the Requester promises to honour.

### 551 2.10.1 SOL1 Query String Attributes

552 **urn:tas3:sol:vers** Identifies the version of SOL. Always "1" for SOL1.

553 **urn:tas3:sol1:use** How information can or will be used and shared. A comma separated list of  
 554 enumerators in the order of principally intended use (ordered here, in our opinion, from least ag-  
 555 gressive to more aggressive as indicated; however this ordering is subjective and other opinions may

556 exist). The `urn:tas3:sol1:use:purpose` should be favoured over `urn:tas3:sol1:use`, unless  
 557 the vague meaning of `urn:tas3:sol1:use` is desired.

558 **`urn:tas3:sol1:use:transaction (0)`** Information will only be used for the transaction  
 559 for which it was collected

560 **`urn:tas3:sol1:use:session (1)`** Information will only be used within the current session

561 **`urn:tas3:sol1:use:user (2)`** Information can be used in the user's other sessions in the  
 562 same app

563 **`urn:tas3:sol1:use:forpurpose (3)`** Information will be used only for the purpose it was  
 564 collected, in abstract. This usage is discouraged. Instead the specific purpose should be speci-  
 565 fied using format

566 `urn:tas3:sol1:use:purpose=business-process-model-id; or`  
 567 `urn:tas3:sol1:use:purpose=business-process-instance-id`

568 These two forms allow the obligation to be tied into the model in abstract, or to the specific  
 569 business process instance in particular, e.g. for exceptional processing such as Break-the-  
 570 Glass.

571 **`urn:tas3:sol1:use:serveranon (4)`** Information can be used by other processes on same  
 572 server as long as user is not explicitly identified

573 **`urn:tas3:sol1:use:serverident (5)`** Information can be used by other processes on same  
 574 server (user may be identified)

575 **`urn:tas3:sol1:use:appanon (6)`** Information can be used by the application towards other  
 576 purposes as long as the user is not explicitly identified

577 **`urn:tas3:sol1:use:appid (7)`** Information can be used by the application towards other  
 578 purposes (user may be identified)

579 **`urn:tas3:sol1:use:organon (8)`** Information can be used by the organization for other  
 580 nonmarketing purposes as long as the user is not explicitly identified

581 **`urn:tas3:sol1:use:orgident (9)`** Information can be used by the organization for other  
 582 nonmarketing purposes (user may be identified)

583 **`urn:tas3:sol1:use:mktanon (10)`** Information can be used by the organization for market-  
 584 ing purposes as long as the user is not explicitly identified

585 **`urn:tas3:sol1:use:mktident (11)`** Information can be used by the organization for mar-  
 586 keting purposes (user may be identified)

587 **`urn:tas3:sol1:use:grpanon (12)`** Information can be used within the business group for  
 588 other nonmarketing purposes as long as the user is not explicitly identified

589 **`urn:tas3:sol1:use:grpident (13)`** Information can be used within the business group for  
 590 other nonmarketing purposes (user may be identified)

591 **`urn:tas3:sol1:use:grpmktanon (14)`** Information can be used within the business group  
 592 for marketing purposes as long as user is not explicitly identified

593 **`urn:tas3:sol1:use:grpmktident (15)`** Information can be used within the business group  
 594 for marketing purposes (user may be identified)

595 **`urn:tas3:sol1:use:shareanon (16)`** Information can be shared with anyone for other non-  
 596 marketing purposes as long as the user is not explicitly identified

597 **`urn:tas3:sol1:use:shareident (17)`** Information can be shared with anyone for other  
 598 nonmarketing purposes (user may be identified)

599 **`urn:tas3:sol1:use:sharemktanon (18)`** Information can be shared with anyone for mar-  
 600 keting purposes as long as user is not explicitly identified

601 **urn:tas3:sol1:use:sharemktident (19)** Information can be shared with anyone for mar-  
 602 keting purposes (user may be identified)

603 **urn:tas3:sol1:use:anyall (20)** Information can be used for any and all purposes without  
 604 restriction.

605 **urn:tas3:sol1:use:purpose** Specific business process that is allowed to use the data. This can  
 606 be specified either as abstract business-process-model-id or as business-process-instance-id. For  
 607 example:

608 urn:tas3:sol1:use:purpose=business-process-model-id; or  
 609 urn:tas3:sol1:use:purpose=business-process-instance-id

610 These two forms allow the obligation to be tied into the model in abstract, or to the specific business  
 611 process instance in particular, e.g. for exceptional processing such as Break-the-Glass.

612 **urn:tas3:sol1:delon** Delete data on as Unix seconds since epoch. This obligation effectively  
 613 allows control of data retention, but instead of being expressed in relative terms, it is expressed in  
 614 absolute terms that are legally easier to interpret.

615 **urn:tas3:sol1:retention** Maximum data retention period as Unix seconds. This obligation is  
 616 meant for database storage. Upon act of data access, retention should be converted to delon using  
 617 current wall clock time.

618 **urn:tas3:sol1:certdel** Certify deletion by legally binding report to the audit bus.

619 **urn:tas3:sol1:preauth** Before each use of the data, user's explicit consent - preauthorization -  
 620 has to be obtained. Value specifies where to obtain preauthorization.

621 **urn:tas3:sol1:callback** When about to use data, call back to the user for opportunity to modify  
 622 the data, or deny it. Value specifies where to call back.

623 **urn:tas3:sol1:repouse** Report use to the audit bus. Comma separated list of enumerators:

624 **urn:tas3:sol1:repouse:never** No need to report use (seldom appears)

625 **urn:tas3:sol1:repouse:all** Report any and all use

626 **urn:tas3:sol1:repouse:oper** Report operational use, but not statistical or administrative  
 627 use.

628 **urn:tas3:sol1:repouse:stat:immed** Report use in near real time. for day need to be  
 629 reported, if there was any use.

630 **urn:tas3:sol1:repouse:stat:daily** No need to report individual use, but summary  
 631 statistics for day need to be reported, if there was any use.

632 **urn:tas3:sol1:repouse:stat:weekly** No need to report individual use, but summary  
 633 statistics for week need to be reported, if there was any use.

634 **urn:tas3:sol1:repouse:stat:monthly** No need to report individual use, but summary  
 635 statistics for month need to be reported, if there was any use.

636 **urn:tas3:sol1:repouse:stat:quarterly** No need to report individual use, but sum-  
 637 mary statistics for quarter (last 3 months) need to be reported, if there was any use.

638 **urn:tas3:sol1:repouse:stat:semestral** No need to report individual use, but sum-  
 639 mary statistics for semester (last 6 months) need to be reported, if there was any use.

640 **urn:tas3:sol1:repouse:stat:yearly** No need to report individual use, but summary  
 641 statistics for year need to be reported, if there was any use.

642 If no `urn:tas3:sol1:repose:stat` is specified, default is `urn:tas3:sol1:repose:stat:immed`.  
 643 If conflicting enumerators are specified, the most strict one applies.

644 **urn:tas3:sol1:xborder** Enumerator describing what sort of cross border data sharing can occur:

645 **urn:tas3:sol1:xdom:eu** Only within EU common market.

646 **urn:tas3:sol1:xdom:safeharbour** Common market and safe harbour participants

647 **urn:tas3:sol1:license** Use of information is subject to license specified in the value part. The  
 648 value part should be either URL to online accessible license text, or it should be a URN pointing to  
 649 a well known license.

650 The general assumption is that the license terms are either well known to the system (and pro-  
 651 grammed in) or machine readable. While the user may have to consent to the license at some level,  
 652 it is not meant that this license reference be displayed to user and he required to read and consent  
 653 on the spot.

654 **urn:tas3:sol1:contract-fwk** Framework or governance contract identifier.

655 **urn:tas3:sol1:contract** Contract identifier.

656 **urn:tas3:sol1:contract-sub** Subcontract or amendment identifier

657 **urn:tas3:sol1:contract-part** Part, exhibit, annex, or clause identifier.

658

## 659 2.10.2 Matching Pledges to Sticky Policies and Obligations

660 When delivering response to data request, the Responder outbound PEP compares the pledges that were  
 661 received in the request and checks that the sticky policies and obligations that are attached to the data  
 662 coming from the backend repository can be satisfied given the pledges. This ensures that the Responder  
 663 will never ship out data unless the Requester has clearly committed itself to respect the sticky policies and  
 664 obligations.

### 665 Example

666 Consider the following request

```
667 <e:Envelope>
668   <e:Header>
669     <!-- WS-Addressing headers and wsse:Security with DSIG not shown -->
670     <b:UsageDirective id="USE">
671       <xa:Obligation ObligationID="http://TAS3.eu/TAS3sol/PrivacyPurpose"
672         FulfillOn="Permit">
673         <xa:AttributeAssignment
674           AttributeID="urn:tas3:attribute:obligationDescription"
675           DataType="http://www.w3.org/2001/XMLSchema#string">
676           urn:tas3:sol:vers=1
677           urn:tas3:sol1:delon=1255555377
678           urn:tas3:sol1:use=urn:tas3:sol1:use:purpose
679           urn:tas3:sol1:share=urn:tas3:sol1:share:group
680           urn:tas3:sol1:repose=urn:tas3:sol1:repose:oper
681         </xa:AttributeAssignment>
682       </xa:Obligation>
683     </b:UsageDirective>
684   </e:Header>
685   <e:Body id="BDY">
686     <idhrxml:Query>...</idhrxml:Query></e:Body></e:Envelope>
```

687 Now, backend returns the following data

```

688 <dataItem id="1">
689   <tas3sol:Obligations xmlns:tas3sol="http://tas3.eu/tas3sol/200911/">
690     urn:tas3:sol:vers=1
691     urn:tas3:sol:delon=1255555378
692     urn:tas3:sol1:use=urn:tas3:sol1:use:transaction
693   </>
694   <data>value</>
695 </>
696
697 <dataItem id="2">
698   <tas3sol:Obligations xmlns:tas3sol="http://tas3.eu/tas3sol/200911/">
699     urn:tas3:sol:vers=1
700     urn:tas3:sol:delon=1255555376
701     urn:tas3:sol1:use=urn:tas3:sol1:use:purpose
702     urn:tas3:sol1:repose=urn:tas3:sol1:repose:all
703   </>
704   <data>value</>
705 </>
706
707 <dataItem id="3">
708   <tas3sol:Obligations xmlns:tas3sol="http://tas3.eu/tas3sol/200911/">
709     urn:tas3:sol:vers=1
710     urn:tas3:sol:delon=1255555378
711     urn:tas3:sol1:use=urn:tas3:sol1:use:purpose
712     urn:tas3:sol1:repose=urn:tas3:sol1:repose:oper, repose=urn:tas3:sol1:repose:stat:weekl
713   </>
714   <data>value</>
715 </>

```

716 The first data item would have to be filtered out because its usage policy is "transaction" while requester  
717 pledged usage for intended "purpose". Intended purpose can span many transactions, therefore its broader  
718 than the allowed use. Note that the `delon` constraint would be compatible with the request.

719 The second data item has to be filtered out for two reasons: (i) its `delon` is stricter than what requester  
720 pledged, and (ii) the `repose` constraint is more onerous than requester is willing to perform.

721 The third data item's obligations are compatible with the requester's pledges. It is returned to the  
722 requester.

723 N.B. This is just an example. The way in which the obligations are attached to the data can be  
724 quite different from the illustrated, e.g. internal C data structure rather than XML. It is also  
725 possible that obligations are not stored with the data, but rather generated by a PDP based on  
726 data dependent sticky-policies.

727 Once the Responder Outbound PEP has filtered the data, it is sent, with the obligations, to Requester  
728 which MAY pass the obligations to Obligations Service for enforcement.

### 730 2.10.3 Passing Simple Obligations Dictionaries Around

731 While in SOL1 the set of enumerators is fixed and with fixed meaning which is hardwired to the simplest  
732 PEP implementations, we foresee users inventing additional attributes and enumerators. This raises the  
733 need for the PEP implementations to be configurable or somehow understand the new enumerators on  
734 basis of their semantics.

735 Such configurations and online semantics passing can be achieved with Simple Obligations Dictionaries  
 736 (SODs), which effectively allow the semantics to be declared. The dictionary can be stored in a configura-  
 737 tion file, and we provide SOL1 standard dictionary as `soll.sod` (which you should not modify) and you  
 738 may be able to provide additional dictionary fragments in user editable configuration files. Alternatively,  
 739 the nonstandard dictionary fragments can be passed inline in the protocol by means of `<tas3sol:dict>`  
 740 element.

741 **Example**

```

742 <e:Envelope>
743   <e:Header>
744     <!-- WS-Addressing headers and wsse:Security with DSIG not shown -->
745     <b:UsageDirective id="USE">
746       <xa:Obligation ObligationID="http://TAS3.eu/TAS3sol/PrivacyPurpose"
747         FulfillOn="Permit">
748         <xa:AttributeAssignment
749           AttributeID="urn:tas3:attribute:obligationDescription"
750           DataType="http://www.w3.org/2001/XMLSchema#string">
751           urn:tas3:sol:vers=1
752           urn:tas3:soll:delon=1255555377
753           urn:tas3:soll:use=urn:tas3:soll:use:purpose
754           urn:tas3:soll:share=urn:tas3:soll:share:group
755           urn:tas3:soll:repouse=urn:tas3:soll:repouse:oper
756         </>
757       </>
758     <tas3sol:Dict xmlns:tas3sol="http://tas3.eu/tas3sol/200911/">
759       Entities:
760         Data Subject (Agent the Data describes)
761         Data Processor (Agent that processes the Data)
762         Data (Information which is a resource under protection)
763         Organisation (a Data Processor)
764         Marketing (an Action)
765         Process (an Action of manipulating Data)
766
767       Relations:
768         Identify
769         Retain
770
771       Property
772         May (property of an action)
773         Must (property of an action)
774
775       urn:tas3:soll:use:mktident is an enumerator of urn:tas3:soll:use
776
777       urn:tas3:soll:use:mktident means
778         Organization (who) - Process (action) - Data (what) - Marketing (why)
779         Organization (who) - Identify (action) - Data Subject (What)
780     </>
781   </>
782 </e:Header>
783 <e:Body id="BDY">
784   <idhrxml:Query>...</></></>
  
```

785 This example uses `<tas3sol:dict>` element to define a new enumerator for `urn:tas3:soll:use`

786 by spelling out its semantic meaning in terms of the dictionary items (example is somewhat unrealistic  
 787 because you should not repeat or redefine dictionary entries from the standard `sol1.sod`). In particular the  
 788 `mktident` really is a combination of two consequences: you will receive spam and you will be identified.  
 789 Thus the "means" declaration has two lines.

## 791 2.11 Realization of Sticky Policies

792 As discussed in [TAS3ARCH] section 4.1 "Protocol Support for Conveyance of Sticky Policies", En-  
 793 capsulating Security Layer (ESL) is one approach for implementing sticky policies. For implementing this  
 794 approach, we recommend using a special SOAP header that specifies the sticky policies and references the  
 795 data objects to which they apply. The reference is either by XML `id` attribute (preferred) or a simplified  
 796 absolute XPath [XPATH99].

### 797 Example

```

798 <e:Envelope>
799   <e:Header>
800     <wsse:Security>...</>
801     <tas3:ESLPolicies mustUnderstand="1">
802       <tas3:ESLApply>
803         <tas3:ESLRef ref="#data1"/>
804         <tas3:ESLRef xpath="container/subcontainer"/>
805         <xa:Obligation ObligationID="http://TAS3.eu/TAS3sol/PrivacyPurpose">
806           <xa:AttributeAssignment
807             AttributeID="urn:tas3:attribute:obligationDescription"
808             DataType="http://www.w3.org/2001/XMLSchema#string">
809             urn:tas3:sol:vers=1
810             urn:tas3:sol1:delon=1255555377
811           </xa:AttributeAssignment>
812         </xa:Obligation>
813       </tas3:ESLApply>
814       <tas3:ESLApply>
815         <tas3:ESLRef ref="#data2"/>
816         <xa:Obligation ObligationID="http://TAS3.eu/TAS3sol/PrivacyPurpose">
817           <xa:AttributeAssignment
818             AttributeID="urn:tas3:attribute:obligationDescription"
819             DataType="http://www.w3.org/2001/XMLSchema#string">
820             urn:tas3:sol:vers=1
821             urn:tas3:sol1:delon=1255566666
822           </xa:AttributeAssignment>
823         </xa:Obligation>
824       </tas3:ESLApply>
825     </tas3:ESLPolicies>
826   </e:Header>
827   <e:Body>
828     <data id="data1" value="foo">
829     <data id="data2" value="bar">
830     <container>
831       <subdata value="goo"/>
832     </container>
833   </e:Body>
834 </e:Envelope>
    
```

835 In the above example both `id` based references to `<data>` and XPath based reference for the `<subdata>`  
 836 are illustrated. It also illustrates how to apply different sticky policies (n.b. Obligation is a particularly

838 common type of sticky policy) to different data.

## 839 2.12 Passing Additional Credentials in Web Service Call

840 The usual way to pass credentials is using an attribute assertion inside `<wsse:Security>` header. Such  
 841 attribute assertion identifies the calling user. Sometimes additional credentials identifying the actual re-  
 842 source are passed in `<TargetIdentity>` SOAP header. However, both of these methods basically admit  
 843 single credential (which can contain other credentials as attributes) typically not signed by the Requester.  
 844 If Requester needs to add additional credentials, it can use `<tas3:Credentials>` element.

```
845 <e:Envelope>
846   <e:Header>
847     <wsse:Security>...</>
848     <tas3:Credentials>
849       ... reuse XACML or SAML attribute schema
850     </tas3:Credentials>
851   </e:Header>
852   <e:Body>...</>
853 </e:Envelope>
```

854

## 855 3 The Official TAS<sup>3</sup> API (normative, but non-exclusive)

856 Although wire-interoperability is the main goal of the TAS<sup>3</sup> project, we recognize that interoperability  
 857 at software interface level, i.e. interchangeable implementations of an API, is valuable as well. Stan-  
 858 dardization of APIs, in addition to wire protocols, helps to promote building a culture and community of  
 859 programmers catering for the TAS<sup>3</sup> platform. Such community fosters adoption through mutual self help  
 860 and shared knowledge base. Supporting full constellation of APIs for all programming languages and  
 861 platforms is fairly expensive business, but is necessary to address the present fragmented market.

862 The TAS<sup>3</sup> API described herein is meant to have multiple implementations. Each implementation  
 863 provides

- 864 • The interface files described herein, such as `tas3.h`
- 865 • Libraries or implementation files that provide the symbols described by the interface files. In as far  
 866 as possible, these will be called `libtas3.so`, `libtas3.dll`, or other appropriate and similar name.  
 867 However a concrete implementation may choose to incorporate the TAS<sup>3</sup> API interface in its own  
 868 library, or may require its own library to be included in addition to the `libtas3.*` library. Such  
 869 additional requirements shall be conspicuously described in the implementation documentation.

870 The official TAS<sup>3</sup> API is not meant to exclude other wire-protocol compatible implementations of TAS<sup>3</sup>.  
 871 Thus, while there is only one official API, other APIs can be equally TAS<sup>3</sup> compatible on the wire.

872 The particular API in use is chosen by the programmer by including the appropriate header file or in-  
 873 terface description. The particular API implementation in use is chosen by the system administrator or  
 874 the programmer by linking against a particular library providing the TAS<sup>3</sup> binary interface, or by dy-  
 875 namically loading a module implementing the said binary interface. This leaves great implementation  
 876 flexibility while accurately describing the TAS<sup>3</sup> interface and implementation at source code (API) and  
 877 binary (ABI) level.

### 879 3.1 Language Independent Description of the API

880 Since all language specific bindings, by-and-large, share the same semantics, the functions and methods  
 881 are first described generically, using pseudocode if needed. Each language binding takes same parameters  
 882 and behaves in the way that API would naturally work, *mutantis mudandis*, for that language.<sup>1</sup>

883 The five essential APIs are

884 *tas3\_sso()* SSO (with optional application independent authorization)

885 *tas3\_az()* Application Dependent Authorization

886 *tas3\_call()* Web Services Client: call a web service and validate response

887 *tas3\_wsp\_validate()* Validate that web service request can be processed

888 *tas3\_wsp\_decorate()* Create a web service response

889

#### 890 3.1.1 Single Sign On (SSO) Alternatives

891 The TAS<sup>3</sup> SSO API's primary aim is supporting SAML 2.0 SSO (and SLO) with attribute and bootstrap  
 892 passing. Not all COTS SAML 2.0 SP APIs (or IdPs) are capable of this out of the box. Thus being SAML  
 893 2.0 compatible is a prerequisite, but additional properties, such as specific functions, session level attribute  
 894 pool, and bootstrap cache, must be satisfied as well to be TAS<sup>3</sup> API compliant. The TAS<sup>3</sup> SSO API is  
 895 likely to support in future (as of 2009) in a transparent way InfoCard specification [[CardSpace](#)], and may  
 896 be able to support other SSO specifications as well.

<sup>1</sup>Some procedural bias is evident, even in "object oriented" language bindings. This is due to least-common-denominator syndrome, i.e. desire to have same API for all programming languages.

897 Some alternatives for supporting SSO:

- 898 • `mod_auth_saml` and (Apache) subprocess environment provides a complete solution for SSO layer  
899 if using Apache `httpd` or compatible web server. In such case the SSO is handled without any  
900 programming simply by editing `httpd.conf` (and in some cases `zxid.conf`). The `mod_auth_saml`  
901 configuration directives are the same as in `zxid.org` and they are introduced to `httpd.conf` using  
902 `ZXIDConf` directives.
- 903 • `tas3_sso()` API as complete solution. `tas3_sso()` API implements a state machine that the calling  
904 application must crank by making repeated calls (one per HTTP request until SSO completes). This  
905 approach has a benefit of isolating the calling application from protocol flow specifics and allows  
906 the API to support multiple SSO protocols in a transparent manner.
- 907 • `tas3_sso_servlet.class`: Java servlet that can be configured to Tomcat or other servlet container to  
908 implement SSO for payload servlets. Internally the SSO servlet calls `tas3_simple()`;
- 909 • **Deprecated Alternative**: by steps approach using medium level APIs (deprecated because the logic  
910 of the specific SSO protocol flow would be hardwired into the calling application)

912 **3.1.2 SSO: `ret = tas3_sso(conf, qs, auto_flags)`**

913 The `tas3_sso()` API is essentially a Single Sign-On protocol state machine. Unless the application  
914 already has a valid active session established, it should call `tas3_sso()` upon every HTTP request, passing  
915 in the query string or form submission part as the `qs` argument. The argument is a string and must be  
916 formatted as a query string. The `tas3_sso()` then returns a string which the calling application needs  
917 to interpret to decide what to do next. Possible actions include performing HTTP redirect, sending the  
918 returned string as HTTP response, or completing a successful single sign on.

919 When Single Sign-On is completed, the `tas3_sso()` establishes a session object for holding received  
920 attributes and bootstrap EPRs. These can be accessed from the session either by the calling application,  
921 or by other TAS<sup>3</sup> API functions such as `tas3_az()` and `tas3_call()`. The `tas3_sso()` may incorporate a  
922 configurable frontend policy enforcement point. Such configuration is implementation dependent.

923 There are many options. Most of these have sensible default values or can be specified in a configuration  
924 file. The first parameter either is a configuration object, or a configuration string that modifies or adds to the  
925 default configuration. Some aspects of operation of `tas3_sso()` are affected by the `auto_flags` parameter.

Table 3.1: `tas3_sso()` configuration options that all implementations MUST support

Option	Description
PATH	Path of configuration directory, which contains the configuration file and may contain other implementation dependent information.
URL	Base URL from which the EntityID is formed.

Table 3.2: *tas3\_sso()* AUTO flags

Dec	Hex	Symbol	Description
1	0x01	TAS3_AUTO_EXIT	Call <i>exit(2)</i> , 0=return "n", even if auto CGI
2	0x02	TAS3_AUTO_REDIR	Automatic. handle redirects, assume CGI (calls <i>exit(2)</i> )
4	0x04	TAS3_AUTO_SOAPC	SOAP response handling, content gen
8	0x08	TAS3_AUTO_SOAPH	SOAP response handling, header gen
16	0x10	TAS3_AUTO_METAC	Metadata response handling, content gen
32	0x20	TAS3_AUTO_METAH	Metadata response handling, header gen
64	0x40	TAS3_AUTO_LOGINC	IdP select / Login page handling, content gen
128	0x80	TAS3_AUTO_LOGINH	IdP select / Login page handling, header gen
256	0x100	TAS3_AUTO_MGMTC	Management page handling, content gen
512	0x200	TAS3_AUTO_MGMTH	Management page handling, header gen
1024	0x400	TAS3_AUTO_FORMF	In idp list and mgmt screen, generate form fields
2048	0x800	TAS3_AUTO_FORMT	In idp list & mgmt screen, wrap in <form> tag.
4095	0xffff	TAS3_AUTO_ALL	Enable all automatic CGI behaviour.
4096	0x1000	TAS3_AUTO_DEBUG	Enable debugging output to stderr.
8192	0x2000	TAS3_AUTO_OFMTQ	Output Format Query String
16384	0x4000	TAS3_AUTO_OFMTJ	Output Format JSON

### Example Usage

926

```

927 01 res = tas3_sso(conf, request['QUERY_STRING'], 0x1800);
928 02 switch (substr(res, 0, 1)) {
929 03 case 'L': header(res); return 0; # Redirect
930 04 case 'n': return 0;           # already handled
931 05 case 'b': return my_send_metadata();
932 06 case 'e': return my_render_idp_selection_screen();
933 07 case 'd': return my_start_session_and_render_protected_content();
934 08 default: error_log("Unknown tas3_sso() res(%s)", res); return 0;
935 09 }
    
```

### Return values

936

The return value starts by an action letter and may be followed by data that is relevant for the action.

938 **L** Redirection request (L as in Location header). The full contents of the res is the redirection request,  
 939 ready to be printed to stdout of a CGI. If you want to handle the redirection some other way, you  
 940 can parse the string to extract the URL and do your thing. This res is only returned if you did not  
 941 set TAS3\_AUTO\_REDIR.

942 Example:

```

943 Location: https://sp1.zxidsp.org:8443/zxid?o=C
    
```

944 **C** Content with Content-type header. The res is ready to be printed to the stdout of a CGI, but if you want  
 945 to handle it some other way, you can parse the res to extract the header and the actual body.

946 Example:

```

947 CONTENT-TYPE: text/html
948
949 <title>Login page</title>
950 ...
    
```

951 Example (metadata):

```
952     CONTENT-TYPE: text/xml
953
954     <m:EntityDescriptor>
955     ...
```

956 **Less than (" $<$ ")** Content without headers. This could be HTML content for login page or metadata  
 957 XML. To know which (and set content type correctly), you would have to parse the content.  
 958 This res format is only applicable if you did not specify TAS3\_AUTO\_CTYPE (but did specify  
 959 TAS3\_AUTO\_CONTENT).

960 **n** Do nothing. The operation was somehow handled internally but the *exit(2)* was not called (e.g. TAS3\_AUTO\_SOAP  
 961 was NOT specified). The application should NOT attempt generating any output.

962 **b** Indication that the application should send SP metadata to the client. This res is only returned if you  
 963 did not set TAS3\_AUTO\_META.

964 **c** Indication that the application should send SP CARML declaration to the client. This res is only re-  
 965 turned if you did not set TAS3\_AUTO\_META.

966 **e** Indication that the application should display the idp selection page. This res is only returned if you did  
 967 not set TAS3\_AUTO\_CONTENT.

968 **d** Indication that SSO has been completed or that there was an existing valid session in place. The res is  
 969 an LDIF entry containing attributes that describe the SSO or session.

```
970     dn: idpnid=Pa45XAs2332SDS2asFs,affid=https://idp.demo.com/idp.xml
971     objectclass: zxidsession
972     affidavit: https://idp.demo.com/idp.xml
973     idpnid: Pa45XAs2332SDS2asFs
974     authnctxlevel: password
975     sesid: S12aF3Xi4A
976     cn: Joe Doe
```

977 Usually your application would parse the attributes and then render its application specific content.

978 **z** Authorization failure. Application MUST NOT display protected content. Instead, it should offer  
 979 user interface where the user can understand what happened and possibly gain the extra credentials  
 980 needed.

981 **Asterisk ("\*")** Although any unknown letter should be interpreted as an error, we follow convention of  
 982 prefixing errors with an asterisk ("\*").  
 983

### 984 3.1.3 Authorization: decision = *tas3\_az(conf, qs, ses)*

985 Implicit application independent authorization steps are performed in *tas3\_sso()* SSO, *tas3\_call()* Ser-  
 986 vice Requester, *tas3\_wsp\_validate()*, and *tas3\_wsp\_decorate()* APIs. To activate them, you need to supply  
 987 appropriate configuration options. Specifics of this configuration are implementation dependent.

988 The *tas3\_az()* function is the main work horse for requesting authorization decisions from the PDPs.  
 989 It allows programmer to make Application Dependent authorization calls, supplying some or all of the  
 990 attributes needed in a XACML request. *tas3\_az()* can also use attributes from the session, if configured.  
 991 Specifics of this configuration are implementation dependent.

992 **conf** the configuration string or object

993 **qs** if supplied, any CGI variables are imported to session environment as attributes according to configu-  
 994 ration. Format is CGI Query String.

995 **ses** attributes are obtained from the session, if supplied (see also CGI). Session ID can be supplied as a  
 996 string or a session object can be passed.

997 **return** 0 if deny (for any reason, e.g. indeterminate), or string if permit

#### 998 **Example Pseudocode**

```

999 cf = tas3_new_conf();
1000 ses = tas3_alloc_ses(cf);
1001 ret = tas3_simple_cf_ses(cf, 0, $QUERY_STRING, ses, 0, 0x1800);
1002 if (ret =~ /^d/) {
1003     perr "SSO ok, now checking authorization";
1004     if (tas3_az_cf_ses(cf, "Action=SHOW&BusinessProcess=register:emp", ses))
1005         perr "Permit, add code to deliver application content";
1006     else
1007         perr "Deny, send back an error";
1008 }
1009

```

#### 1010 **3.1.4 Web Service Call: ret\_soap = tas3\_call(cf, ses, svctype, url, di\_opt,** 1011 **az\_cred, req\_soap)**

1012 *tas3\_call()* first checks if req\_soap string is already a SOAP envelope. If not it will supply missing  
 1013 <Envelope> and <Body> elements. The idea is that the programmer can concentrate on application layer  
 1014 and the *tas3\_call()* will supply the rest automatically. If, however, the programmer wishes to pass some  
 1015 SOAP headers, he can do so by passing the entire envelope. Even if entire envelope is passed, *tas3\_call()*  
 1016 will add TAS<sup>3</sup> specific headers and signatures to this envelope.

1017 Similarly on return, *tas3\_call()* will check all TAS<sup>3</sup> relevant SOAP headers and signatures, but will  
 1018 still return the entire SOAP envelope as a string so that the application layer can, if it wants, look at the  
 1019 headers.

1020 Next, *tas3\_call()* will attempt to locate an EPR for the service type. This may already be in the session  
 1021 cache, or a discovery step may be performed. If discovery is needed it will be automatically made. The  
 1022 discovery can be constrained using url and di\_opt parameters. For example, if there is a predetermined  
 1023 (list of) service provider(s), the url parameter can be used to force the choice. Discovery may still be  
 1024 done to obtain credentials needed for the call, but the discovery result will be constrained to match the  
 1025 supplied url. See section *tas3\_get\_epr()* for description of explicit discovery.

1026 Before actual SOAP call, *tas3\_call()* may contact a PDP to authorize the outbound call. This corre-  
 1027 sponds to application independent *Requester Out PEP* and is configurable: you can disable it if you prefer  
 1028 to make an explicit application dependent call to *tas3\_az()*. The attributes for the XACML request are  
 1029 mainly derived from the session, but additional attributes can be supplied with az\_cred parameter, which  
 1030 has query string format. Functioning of the authorization step can be controlled using configuration, which  
 1031 is implementation dependent.

1032 Then *tas3\_call()* augments the XML data structure with Liberty ID-WSF mandated headers. It will  
 1033 look at the security mechanism and token specified in the EPR and perform appropriate steps to create  
 1034 WS-Security header and apply signature as needed.

1035 After executing the SOAP call and verifying any returned TAS<sup>3</sup> relevant headers and signatures, *tas3\_call()*  
 1036 may contact a PDP to authorize receiving data, and to pass on any obligations that were received. This  
 1037 corresponds to application independent *Requester In PEP* and is configurable: you can disable it if you  
 1038 prefer to make explicit application dependent call to *tas3\_az()*. The contents of the XACML request are  
 1039 determined based on the response, session, az\_cred parameter, which is shared for both Responder Out  
 1040 and Responder In PDP calls, and configuration, which is implementation dependent.

- 1041 **cf** Configuration object, see *tas3\_new\_conf\_to\_cf()*
- 1042 **ses** Session object, used to locate EPRs, see *tas3\_new\_ses()*
- 1043 **svctype** Service type and namespace URN that is applicable to the body. Passed as a string.
- 1044 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
1045 endpoint URL.
- 1046 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format
- 1047 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format. These creden-  
1048 tials will be populated to the session's attribute pool in addition to the ones obtained from SSO  
1049 and other sources. Then a PDP is called to get an authorization decision (as well as obligations  
1050 we pledge to support). This implements generalized (application independent) Requester Out and  
1051 Requester In PEPs. To implement application dependent PEP features you should call *tas3\_az()*  
1052 directly.
- 1053 **req\_soap** string used as SOAP body or as SOAP envelope template.
- 1054 **return** SOAP envelope as a string.

1055 **Example**

```

1056 01 env = tas3_callf(cf, ses, 0,0,0, "urn:hrxml:idhrxml",
1057 02     "<idhrxml:Modify>"
1058 03     "<idhrxml:ModifyItem>"
1059 04     "<idhrxml:Select>%s</idhrxml:Select>"
1060 05     "<idhrxml:NewData>%s</idhrxml:NewData>"
1061 06     "</idhrxml:ModifyItem>"
1062 07     "</idhrxml:Modify>", cgi.select, cgi.data);

```

1063 As can be seen, the paradigm is to supply the payload data as a string. Although it could be supplied  
1064 as a data structure, constructed with many constructors, our experience has shown that string representa-  
1065 tion is most intuitive and self documenting for most programmers. Despite abandoning the constructor  
1066 approach, all relevant syntax and schema checks are internally done by simply parsing the string and then  
1068 reserializing it before sending to the wire. This tends to be necessary anyway due to signature generation.

1069 **3.1.5 Responder in: tgtnid = *tas3\_wsp\_validate(cf, ses, az\_cred, soap\_req)***

1070 Validate SOAP request (envelope), specified by the string *soap\_req*. Service Responder should call  
1071 this function to validate an inbound, received, TAS<sup>3</sup> request. This will

- 1072 • verify signatures
- 1073 • determine trust
- 1074 • populate to WSP's session any credentials found in the request
- 1075 • possibly perform an application independent *Responder In PEP* authorization, calling a PDP behind  
1076 the scenes using *tas3\_az()*.

1077 After *tas3\_wsp\_validate()*, the application needs to, in application dependent way, extract from the  
1078 response the application payload and process it. However, this is much simplified as there is no need to  
1079 perform any further verification.

1080 If the string *soap\_req* starts by "<e:Envelope", then it should be a complete SOAP envelope including  
1081 <e:Header> (and <e:Body>) parts.

1082 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1083 **ses** Session object that contains the EPR cache, see *tas3\_new\_ses()*

1084 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format. These creden-  
 1085 tials will be populated to the attribute pool in addition to the ones obtained from token and other  
 1086 sources. Then a PDP is called to get an authorization decision (matching obligations we support  
 1087 to those in the request, and obligations pledged by caller to those we insist on). This implements  
 1088 generalized (application independent) *Responder In PEP*. To implement application dependent PEP  
 1089 features you should call *tas3\_az()* directly.

1090 **soap\_req** Entire SOAP envelope as a string

1091 **return** idpnid, as a string, of the target identity of the request (rest of the information is populated to the  
 1092 session object, from where it can be retrieved).

1093

### 1094 3.1.6 Responder out: soap = *tas3\_wsp\_decorate(cf, ses, az\_cred, soap\_resp)*

1095 Add ID-WSF (and TAS3) specific headers and signatures to web service response. Simple and intuitive  
 1096 specification of XML as string: no need to build complex data structures.

1097 Service responder should prepare application layer of the response and then call this function to decorate  
 1098 the response with TAS3 specifics, and to wrap it in SOAP envelope. This will

- 1099 • add correlation headers
- 1100 • possibly perform an application independent *Responder Out PEP* authorization step, calling a PDP  
 1101 behind the scenes using *tas3\_az()*.
- 1102 • apply signature

1103 If the string starts by "<e:Envelope", then string should be a complete SOAP envelope including  
 1104 <e:Header> and <e:Body> parts. This allows caller to specify custom SOAP headers, in addition to  
 1105 the ones that the underlying *zxid\_wsc\_call()* will add. Usually the payload service will be passed as the  
 1106 contents of the body. If the string starts by "<e:Body", then the <e:Envelope> and <e:Header> are  
 1107 automatically added. If the string starts by neither of the above (be careful to use the "e:" as namespace  
 1108 prefix), the it is assumed to be the payload content of the <e:Body> and the rest of the SOAP envelope is  
 1109 added.

1110 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1111 **ses** Session object that contains the EPR cache

1112 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format. These cre-  
 1113 dentials will be populated to the attribute pool in addition to the ones obtained from token and  
 1114 other sources. Then a PDP is called to get an authorization decision (generating obligations). This  
 1115 implements generalized (application independent) *Responder Out PEP*. To implement application  
 1116 dependent PEP features you should call *tas3\_az()* directly.

1117 **soap\_resp** XML payload as a string

1118 **return** SOAP Envelope of the response, as a string, ready to be sent as HTTP response.

1119

1120 **3.1.7 Explicit Discovery: *epr = tas3\_get\_epr(cf, ses, svc, url, di\_opt, act, n)***

1121 N.B. This function is automatically called by *tas3\_call()* so making an explicit call is seldom  
 1122 needed. You may consider making such call if you need to know which EPR is actually found  
 1123 and you want to query some properties of the EPR. You can then pass the URL, as found using  
 1124 *tas3\_get\_epr\_url()*, as an argument to *tas3\_call()* to constrain the call to use a specific EPR.

1125 First search epr cache, and if miss, go discover an EPR over the net. This is the main work horse for  
 1126 WSCs wishing to call WSPs via EPR.

1127 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1128 **ses** Session object in whose EPR cache the file will be searched

1129 **svc** Service type (usually a URN). String.

1130 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
 1131 endpoint URL. String.

1132 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format.

1133 **act** (Optional) The action, or method, that must be invocable on the service. String.

1134 **n** How many matching instances is returned. 1 means first. Integer.

1135 **return** EPR data structure on success, null on failure (no discovery EPR in cache, or not found by the  
 1136 discovery service).  
 1137

1138 **3.1.8 *url = tas3\_get\_epr\_url(cf, epr)***

1139 Returns the `<a:Address>` field of an EPR as a string. This is the endpoint URL.

1141 **3.1.9 *entityid = tas3\_get\_epr\_entid(cf, epr)***

1142 Returns the `<di:ProviderID>` field of an EPR as a string. This is same as SAML2 EntityID.

1144 **3.1.10 *a7n = tas3\_get\_epr\_a7n(cf, epr)***

1145 Returns assertion from EPR `<sec:Token>` field as a string.

1146

## 1147 3.2 Java Binding

1148 Before you start using the SSO API, you should consider using the TAS<sup>3</sup> SSO servlet. `tas3_sso_servlet.class`  
 1149 can be configured to Tomcat or other servlet container to implement SSO for payload servlets. Internally  
 1150 the SSO servlet calls `tas3_sso()`.

1151 Similar module is planned (as of 2009) for Responder implementation. The pushable filter module  
 1152 for servlet environments (e.g. Tomcat) will wrap `tas3.wsp_validate()` and `tas3.wsp_decorate()`. The filter  
 1153 module allows some web services to be TAS<sup>3</sup> enabled without modification to the application code.

### 1155 3.2.1 Interface and Initialization

1156 This binding is implemented as `tas3java.class` and `libtas3jni.so` (`libtas3jni.jnilib` on MacOS  
 1157 X, `libtas3jni.dll` on Windows) module.

1158 Typically you need to include in your Java servlet or program something like

```
1159 01 import tas3java.*;
1160 02 static tas3.tas3_conf cf;
1161 03 static {
1162 04     System.loadLibrary("tas3jni");
1163 05     cf = tas3.new_conf_to_cf("/var/tas3/");
1164 06 }
```

1165 This will bring in the functionality of the TAS<sup>3</sup> Java binding and cause the JNI library implementing  
 1166 this functionality to be loaded. It will also create a configuration object that the other parts of a servlet can  
 1167 share.

1168 The Java binding replaces the "tas3\_" prefix in function names with the class prefix "tas3.", for example  
 1169 `tas3_sso()` becomes `tas3.sso()` and `tas3_az()` becomes `tas3.az()`.

1170 The TAS<sup>3</sup> Java interface is defined as follows

```
1171 package tas3;
1172
1173 public interface tas3 {
1174     public static tas3_conf new_conf_to_cf(String conf);
1175     public static tas3_ses new_ses(tas3_conf cf);
1176     public static tas3_ses fetch_ses(tas3_conf cf, String sid);
1177     public static String sso_cf(tas3_conf cf, int qs_len, String qs,
1178         p_int res_len, int auto_flags);
1179     public static int get_ses(tas3_conf cf, tas3_ses ses, String sid);
1180     public static int az_cf_ses(tas3_conf cf, String qs, tas3_ses ses);
1181     public static int az_cf(tas3_conf cf, String qs, String sid);
1182     public static int az(String conf, String qs, String sid);
1183
1184     public static String wsp_validate(tas3_conf cf, tas3_ses ses,
1185         String az_cred, String enve);
1186     public static String wsp_decorate(tas3_conf cf, tas3_ses ses,
1187         String az_cred, String enve);
1188     public static String call(tas3_conf cf, tas3_ses ses,
1189         String svctype, String url, String di_opt,
1190         String az_cred, String enve);
1191     public static tas3_epr get_epr(tas3_conf cf, tas3_ses ses,
1192         String svc, String url, String di_opt,
1193         String action, int n);
```

```

1194     public static String get_epr_url(tas3_conf cf, tas3_epr epr);
1195     public static String get_epr_entid(tas3_conf cf, tas3_epr epr);
1196     public static String get_epr_a7n(tas3_conf cf, tas3_epr epr);
1197 }
1198
1199

```

### 1200 3.2.2 Initialize: **cf = tas3.new\_conf\_to\_cf(conf)**

1201 Create a new TAS3 configuration object given configuration string and possibly configuration file. Us-  
 1202 ally a configuration object is generated and passed around to different API calls to avoid reparsing the  
 1203 configuration at each API call.

1204 **conf** Configuration string

1205 **return** Configuration object

1206

### 1207 3.2.3 New session: **ses = tas3.new\_ses(cf)**

1208 Create a new TAS3 session object. Usually a session object is created just before calling

1209 **cf** Configuration object, see *tas3.new\_conf\_to\_cf()*

1210 **return** Session object

1211

### 1212 3.2.4 SSO: **ret = tas3.sso\_cf\_ses(cf, qs\_len, qs, ses, null, auto\_flags)**

1213 **cf** Configuration object, see *tas3.new\_conf\_to\_cf()*

1214 **qs\_len** Length of the query string. -1 = use *strlen()*

1215 **qs** Query string (or POST content)

1216 **ses** Session object, see *tas3.new\_ses()*. Session object is modified.

1217 **res\_len** Result parameter. Must always pass *null* as result parameters are not supported in the Java  
 1218 binding.

1219 **auto\_flags** Automation flags

1220 **return** String representing protocol action or SSO attributes

1221

### 1222 3.2.5 Authorization: **decision = tas3.az\_cf\_ses(cf, qs, ses)**

1223 **cf** the configuration object, see *tas3.new\_conf\_to\_cf()*

1224 **qs** additional attributes that are passed to PDP

1225 **ses** session object, from which most attributes come

1226 **return** 0 on deny (for any reason, e.g. indeterminate), or non-null if permit.

1227

1228 **3.2.6 WSC: resp\_soap = *tas3.call(cf, ses, svctype, url, di\_opt, az\_cred, req\_soap)***

1229 **cf** Configuration object, see *tas3.new\_conf\_to\_cf()*

1230 **ses** Session object, used to locate EPRs, see *tas3.new\_ses()*

1231 **svctype** Service type and namespace URN that is applicable to the body. Passed as a string.

1232 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
1233 endpoint URL.

1234 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1235 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1236 **req\_soap** string used as SOAP body or as SOAP envelope template.

1237 **return** SOAP envelope as a string

1238

1239 **3.2.7 WSP: tgtid = *tas3.wsp\_validate(cf, ses, az\_cred, soap\_req)***

1240 **cf** TAS<sup>3</sup> configuration object, see *tas3.new\_conf\_to\_cf()*

1241 **ses** Session object that contains the EPR cache, see *tas3.new\_ses()*

1242 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1243 **soap\_req** Entire SOAP envelope as a string

1244 **return** idpnid, as a string, of the target identity of the request (rest of the information is populated to the  
1245 session object, from where it can be retrieved).

1246

1247 **3.2.8 WSP: soap = *tas3.wsp\_decorate(cf, ses, az\_cred, soap\_resp)***

1248 **cf** TAS<sup>3</sup> configuration object, see *tas3.new\_conf\_to\_cf()*

1249 **ses** Session object that contains the EPR cache

1250 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1251 **soap\_resp** XML payload, as a string

1252 **return** SOAP Envelope of the response, as a string, ready to be sent as HTTP response.

1253

1254 **3.2.9 Explicit Discovery: epr = *tas3.get\_epr(cf, ses, svc, url, di\_opt, act, n)***

1255 First search epr cache, and if miss, go discover an EPR over the net. This is the main work horse for  
1256 WSCs wishing to call WSPs via EPR.

1257 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1258 **ses** Session object in whose EPR cache the file will be searched

1259 **svc** Service type (usually a URN)

1260 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
1261 endpoint URL.

1262 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1263 **act** (Optional) The action, or method, that must be invocable on the service

1264 **n** How many matching instances are returned. 1 means first

1265 **return** EPR data structure on success, 0 on failure (no discovery EPR in cache, or not found by the  
1266 discovery service).

1267

### 1268 **3.2.10 url = tas3.get\_epr\_url(cf, epr)**

1269 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1270 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1271 **return** The <a:Address> field of an EPR as a string. This is the endpoint URL.

1272

### 1273 **3.2.11 entityid = tas3.get\_epr\_entid(cf, epr)**

1274 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1275 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1276 **return** The <di:ProviderID> field of an EPR as a string. This is same as SAML2 EntityID.

1277

### 1278 **3.2.12 a7n = tas3.get\_epr\_a7n(cf, epr)**

1279 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1280 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1281 **return** Assertion from EPR <sec:Token> field as a string.

1282

### 1283 **3.2.13 Available Implementations (Non-normative)**

1284 This binding is implemented using Java Native Interface calls to *zxid.org* C library by *zxidjni* module.

1285 Other implementations are welcome.

1286

## 1287 3.3 PHP Binding

1288 Using TAS<sup>3</sup> PHP APIs requires first loading the TAS<sup>3</sup> module and creating a configuration object.  
 1289 These are typically accomplished from PHP initialization. You may consider creating `tas3.ini` file:

```
1290 dl("php_tas3.so");
1291 $cf = tas3_new_conf_to_cf("PATH=/var/tas3/");
1292
```

### 1293 3.3.1 Application Level Integration

1294 It should be noted that many PHP applications run inside Apache httpd and therefore can accomplish  
 1295 SSO using `mod_auth_saml` approach without any programming. Especially useful is `mod_auth_saml`'s  
 1296 ability to "fake" `REMOTE_USER` subprocess environment variable, effectively enabling any application  
 1297 that supports HTTP basic authentication to also support SAML SSO.

1298 We expect to provide specific integration examples for some software packages. As of 2009 none are  
 1299 available, but Mahara is one of the first ones planned.

### 1301 3.3.2 `cf = tas3_new_conf_to_cf(conf)`

1302 **conf** Configuration string

1303 **return** Configuration object

1304

### 1305 3.3.3 `ses = tas3_new_ses(cf)`

1306 Create a new TAS3 session object. Usually a session object is created just before calling

1307 **cf** Configuration object

1308 **return** Session object

1309

### 1310 3.3.4 SSO: `ret = tas3_sso_cf_ses(cf, -1, qs, ses, null, auto_flags)`

1311 **cf** Configuration object, see `tas3_new_conf_to_cf()`

1312 **qs\_len** Length of the query string. -1 = use `strlen()`

1313 **qs** Query string (or POST content)

1314 **ses** Session object, see `tas3_new_ses()`. Session object is modified.

1315 **res\_len** Should always be passed as null (result parameter is not supported for PHP).

1316 **auto\_flags** Automation flags

1317 **return** String representing protocol action or SSO attributes

#### 1318 Example

```
1319 01 <?
1320 02 $qs = $_SERVER['REQUEST_METHOD'] == 'GET'
1321 03     ? $_SERVER['QUERY_STRING']
1322 04     : file_get_contents('php://input');
1323 05 $ses = tas3_new_ses($cf);
```

```

1324 06 $res = tas3_sso_cf_ses($cf, -1, $qs, $ses, null, 0x1814);
1325 07 switch (substr($res, 0, 1)) {
1326 08 case 'L': header($res); exit; # Redirect (Location header)
1327 09 case '<': header('Content-type: text/xml'); echo $res; exit;
1328 10 case 'n': exit; # Already handled
1329 11 case 'e': my_render_idp_select();
1330 12 case 'd': break; # Logged in case
1331 13 default: die("Unknown res($res)");
1332 14 }
1333 15
1334 16 if (tas3_az_cf_ses($cf, "Action=Show", $ses)) {
1335 17     echo "Permit.\n";
1336 18     # Render protected content here
1337 19 } else {
1338 20     echo "<b>Deny.</b>";
1339 21 }
1340 22 ?>
1341

```

### 1342 3.3.5 Authorization: decision = *tas3\_az\_cf\_ses(cf, qs, ses)*

1343 **cf** the configuration object

1344 **qs** additional attributes that are passed to PDP

1345 **ses** session object, from which most attributes come

1346 **return** 0 on deny (for any reason, e.g. indeterminate), or non-null if permit.

1347

### 1348 3.3.6 WSC: resp\_soap = *tas3\_call(cf, ses, svctype, url, di\_opt, az\_cred, req\_soap)*

1349 **cf** Configuration object, see *tas3\_new\_conf\_to\_cf()*

1350 **ses** Session object, used to locate EPRs, see *tas3\_new\_ses()*

1351 **svctype** Service type and namespace URN that is applicable to the body. Passed as a string.

1352 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
 1353 endpoint URL.

1354 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1355 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1356 **req\_soap** string used as SOAP body or as SOAP envelope template.

1357 **return** SOAP envelope as a string

#### 1358 Example

```

1359 01 $ret = tas3_call($cf, $ses, "urn:id-sis-idhrxml:2007-06:dst-2.1",
1360 02     null, null, null,
1361 03     "<idhrxml:Query>" .
1362 04     "    <idhrxml:QueryItem>" .
1363 05     "        <idhrxml:Select>$criteria</idhrxml:Select>" .
1364 06     "    </idhrxml:QueryItem>" .
1365 07     "</idhrxml:Query>");

```

1366

1367 **3.3.7 WSP: tgtid = *tas3\_wsp\_validate(cf, ses, az\_cred, soap\_req)***

1368 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1369 **ses** Session object that contains the EPR cache, see *tas3\_new\_ses()*

1370 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1371 **soap\_req** Entire SOAP envelope as a string

1372 **return** idpnid, as a string, of the target identity of the request (rest of the information is populated to the  
1373 session object, from where it can be retrieved).

1374

1375 **3.3.8 WSP: soap = *tas3\_wsp\_decorate(cf, ses, az\_cred, soap\_resp)***

1376 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1377 **ses** Session object that contains the EPR cache

1378 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1379 **soap\_resp** XML payload, as a string

1380 **return** SOAP Envelope of the response, as a string, ready to be sent as HTTP response.

1381

1382 **3.3.9 Explicit Discovery: epr = *tas3\_get\_epr(cf, ses, svc, url, di\_opt, act, n)***

1383 First search epr cache, and if miss, go discover an EPR over the net. This is the main work horse for  
1384 WSCs wishing to call WSPs via EPR.

1385 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1386 **ses** Session object in whose EPR cache the file will be searched

1387 **svc** Service type (usually a URN)

1388 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
1389 endpoint URL.

1390 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1391 **act** (Optional) The action, or method, that must be invocable on the service

1392 **n** How many matching instances are returned. 1 means first

1393 **return** EPR data structure on success, 0 on failure (no discovery EPR in cache, or not found by the  
1394 discovery service).

1395

1396 **3.3.10 url = *tas3\_get\_epr\_url(cf, epr)***

1397 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1398 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1399 **return** The <a:Address> field of an EPR as a string. This is the endpoint URL.

1400

1401 **3.3.11 entityid = *tas3\_get\_epr\_entid(cf, epr)***

1402 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1403 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1404 **return** The <di:ProviderID> field of an EPR as a string. This is same as SAML2 EntityID.

1405

1406 **3.3.12 a7n = *tas3\_get\_epr\_a7n(cf, epr)***

1407 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1408 **epr** An EPR object, such as obtained from *tas3\_get\_epr()*

1409 **return** Assertion from EPR <sec:Token> field as a string.

1410

1411 **3.3.13 Available Implementations (Non-normative)**

1412 This binding is implemented by `php_zxid` module, available as part of the `zxid.org`

1413

## 1414 3.4 C and C++ Binding

1415 Essentially this is a procedural C binding that is also usable from C++. In fact, the C binding can be  
 1416 used as a base for many other language bindings generated using SWIG [SWIG] interface generator.

1417 The binding is declared in `tas3.h` and implemented in `libtas3.a`, `libtas3.so`, or `libtas3.dll`,  
 1418 depending on the platform. Typical source code file will pull in the TAS<sup>3</sup> API by including

```
1419 #include <tas3.h>
```

1420

### 1421 3.4.1 `cf = tas3_new_conf_to_cf(conf)`

1422 **Prototype**

```
1423 tas3_conf* tas3_new_conf_to_cf(const char* conf);
```

1424 Create a new TAS3 configuration object given configuration string and possibly configuration file. Usually  
 1425 a configuration object is generated and passed around to different API calls to avoid reparsing the  
 1426 configuration at each API call.

1427 **conf** Configuration string

1428 **return** Configuration object

1429

### 1430 3.4.2 `ses = tas3_new_ses(cf)`

1431 **Prototype**

```
1432 tas3_ses* tas3_new_conf_to_cf(const char* conf);
```

1433 Create a new TAS3 session object. Usually a session object is created just before calling

1434 **cf** Configuration object

1435 **return** Session object

1436

### 1437 3.4.3 SSO: `ret = tas3_sso_cf_ses(cf, qs_len, qs, ses, &res_len, auto_flags)`

1438 **Prototype**

```
1439 char* tas3_sso_cf_ses(tas3_conf* cf, int qs_len, char* qs,  
1440                      tas3_ses* ses, int* res_len, int auto_flags);
```

1441 Strings are length + pointer (no C string nul termination needed).

1442 **cf** Configuration object, see `tas3_new_conf_to_cf()`

1443 **qs\_len** Length of the query string. -1 = use `strlen()`

1444 **qs** Query string (or POST content)

1445 **ses** Session object, see `tas3_new_ses()`. Session object is modified.

1446 **res\_len** Result parameter. If non-null, will be set to the length of the returned string

1447 **auto\_flags** Automation flags

1448 **return** String representing protocol action or SSO attributes

1449 **Example**

```

1450 01 {
1451 02 tas3_conf* cf = tas3_new_conf_to_cf("PATH=/var/tas3/");
1452 03 tas3_ses* ses = tas3_new_ses(cf);
1453 04 char* ret = tas3_sso_cf_ses(cf, -1, env("QUERY_STRING"), ses, 0, 0x1800);
1454 05 switch (ret[0]) {
1455 06 case 'd': break; /* Successful login */
1456 07 ... /* Processing other outcomes omitted for brevity. */
1457 08 }
1458 09 if (tas3_az_cf_ses(cf, "", ses)) {
1459 10 /* SSO successful and authorization permit. Do some work. */
1460 11 } else {
1461 12 /* SSO successful but authorization denied */
1462 13 }
1463 14 }
1464
    
```

1465 **3.4.4 Authorization: decision = *tas3\_az\_cf\_ses(cf, qs, ses)***

1466 **Prototype**

```

1467 char* tas3_az_cf_ses(tas3_conf* cf, const char* qs, tas3_ses* ses);
    
```

1468 Call Policy Decision Point (PDP) to obtain an authorization decision about a contemplated action on a  
 1469 resource.

1470 **cf** the configuration object

1471 **qs** additional attributes that are passed to PDP

1472 **ses** session object, from which most attributes come

1473 **return** 0 on deny (for any reason, e.g. indeterminate), or non-null if permit.

1474

1475 **3.4.5 WSC: resp\_soap = *tas3\_call(cf, ses, svctype, url, di\_opt, az\_cred, req\_soap)***

1476 **Prototype**

```

1477 struct zx_str* tas3_call(tas3_conf* cf, tas3_ses* ses, const char* svctype,
1478     const char* url, const char* di_opt, const char* az_cred,
1479     const char* req_soap);
    
```

1480 **cf** Configuration object, see *tas3\_new\_conf\_to\_cf()*

1481 **ses** Session object, used to locate EPRs, see *tas3\_new\_ses()*

1482 **svctype** Service type and namespace URN that is applicable to the body. Passed as a string.

1483 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
 1484 endpoint URL.

1485 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1486 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1487 **req\_soap** string used as SOAP body or as SOAP envelope template.

1488 **return** SOAP envelope as a string

1489

### 1490 **3.4.6 resp\_soap = tas3\_callf(cf, ses, svctype, url, di\_opt, az\_cred, fmt, ...)**

#### 1491 **Prototype**

```
1492 tas3_str* tas3_callf(tas3_conf* cf, tas3_ses* ses, const char* svctype,
1493     const char* url, const char* di_opt, const char* az_cred,
1494     const char* fmt, ...);
```

1495 The *tas3\_callf()* variant, which allows *printf(3)* style formatting, is highly convenient for C program-  
 1496 mers. Others will probably use the plan *tas3\_call()* and rely on language's native abilities to construct the  
 1497 string.

1498 **cf** Configuration object, see *tas3\_new\_conf\_to\_cf()*

1499 **ses** Session object, used to locate EPRs, see *tas3\_new\_ses()*

1500 **svctype** Service type and namespace URN that is applicable to the body. Passed as a string.

1501 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
 1502 endpoint URL.

1503 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1504 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1505 **fmt** printf style format string that is used to describe the body of the call as a string. If *fmt* contains format  
 1506 specifiers, then additional arguments are used to expand these.

1507 **return** SOAP envelope as a string

1508

### 1509 **3.4.7 WSP: tgtid = tas3\_wsp\_validate(cf, ses, az\_cred, soap\_req)**

#### 1510 **Prototype**

```
1511 char* tas3_wsp_validate(tas3_conf* cf, tas3_ses* ses,
1512     const char* az_cred, const char* soap_req);
```

1513 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1514 **ses** Session object that contains the EPR cache, see *tas3\_new\_ses()*

1515 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1516 **soap\_req** Entire SOAP envelope as a string

1517 **return** idpnid, as a string, of the target identity of the request (rest of the information is populated to the  
 1518 session object, from where it can be retrieved).

1519

### 1520 3.4.8 WSP: soap = *tas3\_wsp\_decorate*(*cf*, *ses*, *az\_cred*, *soap\_resp*)

#### 1521 Prototype

```
1522 tas3_str* tas3_wsp_decorate(tas3_conf* cf, tas3_ses* ses,
1523                             const char* az_cred, const char* soap_resp);
```

1524 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1525 **ses** Session object that contains the EPR cache

1526 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1527 **soap\_resp** XML payload as a string

1528 **return** SOAP Envelope of the response, as a string, ready to be sent as HTTP response.

1529

### 1530 3.4.9 WSP: soap = *tas3\_wsp\_decoratef*(*cf*, *ses*, *az\_cred*, *fmt*, ...)

#### 1531 Prototype

```
1532 tas3_str* tas3_wsp_decorate(tas3_conf* cf, tas3_ses* ses,
1533                             const char* az_cred, const char* fmt, ...);
```

1534 **cf** TAS<sup>3</sup> configuration object, see *tas3\_new\_conf()*

1535 **ses** Session object that contains the EPR cache

1536 **az\_cred** (Optional) Additional authorization credentials or attributes, query string format.

1537 **fmt** printf style format string that is used to describe the body of the response as a string. If *fmt* contains  
1538 format specifiers, then additional arguments are used to expand these.

1539 **return** SOAP Envelope of the response, as a string, ready to be sent as HTTP response.

1540

### 1541 3.4.10 Explicit Discovery: epr = *tas3\_get\_epr*(*cf*, *ses*, *svc*, *url*, *di\_opt*, *act*, *n*)

#### 1542 Prototype

```
1543 tas3_epr* tas3_get_epr(tas3_conf* cf, tas3_ses* ses,
1544                       const char* svc, const char* url, const char* di_opt,
1545                       const char* action, int n);
```

1546 First search epr cache, and if miss, go discover an EPR over the net. This is the main work horse for  
1547 WSCs wishing to call WSPs via EPR.

1548 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1549 **ses** Session object in whose EPR cache the file will be searched

1550 **svc** Service type (usually a URN)

1551 **url** (Optional) If provided, this argument has to match either the ProviderID, EntityID, or actual service  
1552 endpoint URL.

1553 **di\_opt** (Optional) Additional discovery options for selecting the service, query string format

1554 **act** (Optional) The action, or method, that must be invocable on the service

1555 **n** How many matching instances are returned. 1 means first

1556 **return** EPR data structure on success, 0 on failure (no discovery EPR in cache, or not found by the  
1557 discovery service).

1558

### 1559 3.4.11 `url = tas3_get_epr_url(cf, epr)`

1560 **Prototype**

```
1561 tas3_str* tas3_get_epr_url(tas3_conf* cf, tas3_epr* epr);
```

1562 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1563 **epr** An EPR object, such as obtained from `tas3_get_epr()`

1564 **return** The `<a:Address>` field of an EPR as a string. This is the endpoint URL.

1565

### 1566 3.4.12 `entityid = tas3_get_epr_entid(cf, epr)`

1567 **Prototype**

```
1568 tas3_str* tas3_get_epr_entid(tas3_conf* cf, tas3_epr* epr);
```

1569 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1570 **epr** An EPR object, such as obtained from `tas3_get_epr()`

1571 **return** The `<di:ProviderID>` field of an EPR as a string. This is same as SAML2 EntityID.

1572

### 1573 3.4.13 `a7n = tas3_get_epr_a7n(cf, epr)`

1574 **Prototype**

```
1575 tas3_str* tas3_get_epr_a7n(tas3_conf* cf, tas3_epr* epr);
```

1576 **cf** TAS<sup>3</sup> configuration object, also used for memory allocation

1577 **epr** An EPR object, such as obtained from `tas3_get_epr()`

1578 **return** Assertion from EPR `<sec:Token>` field as a string.

1579

### 1580 3.4.14 Available Implementations (Non-normative)

1581 This binding is implemented, at least, by `zxid.org` open source implementation, which serves as the  
1582 reference implementation of the TAS<sup>3</sup> core security architecture.

1583 N.B. The `tas3_sso()` API is implemented by `zxid`'s `zxid_simple()` API.

1584

### 1585 3.5 Other Language Bindings

1586 At present stage of the TAS<sup>3</sup> project (2009) we only offer Java, PHP, and C/C++ bindings, but in future  
1587 we aim supporting also at least the following

- 1588 • C# / .Net / Mono
- 1589 • Perl (currently `zxid.org` derived `Net::SAML` perl module, available from `cpan.org`, supports most  
1590 functionality of TAS<sup>3</sup> API, but this is unofficial)
- 1591 • Python
- 1592 • Ruby

1593 We welcome external contribution and language specialist help in making all these bindings available.  
1594 Please contact Sampo Kellomäki (`sampo@symlabs.com`) if you are interested.

1595

1596

## 4 Deployment and Integration Models (Non-normative)

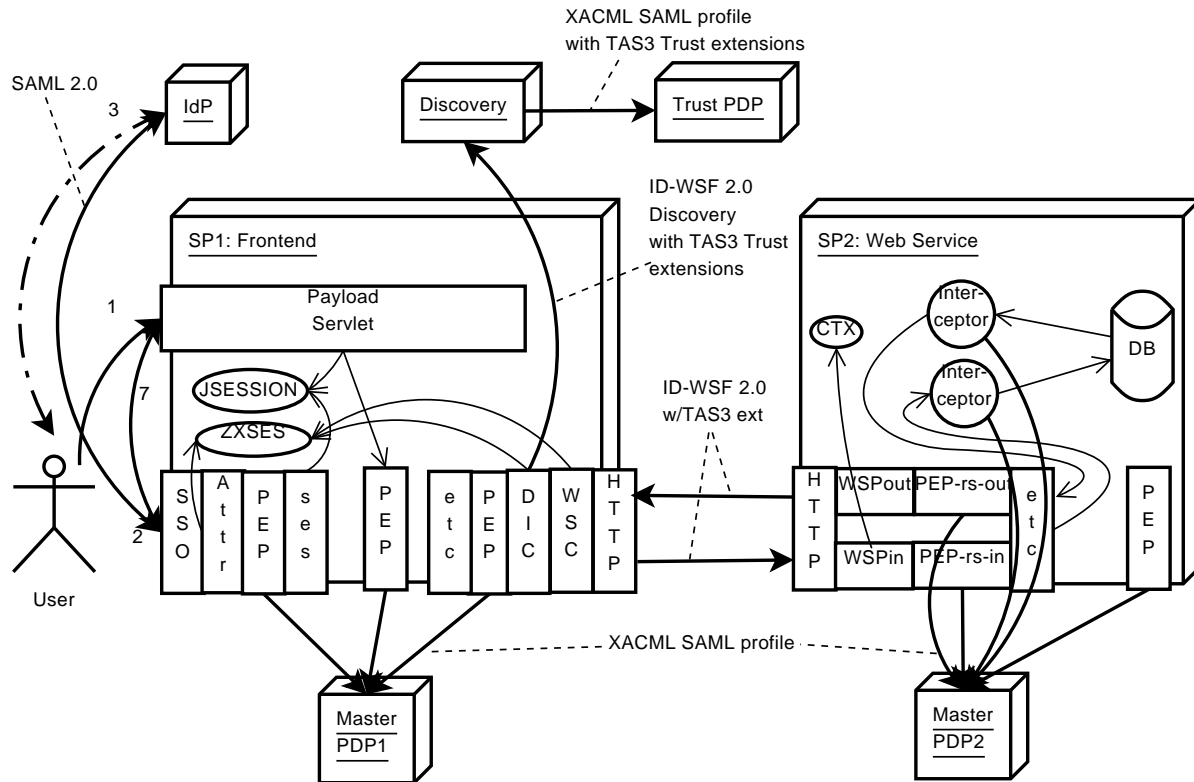

Figure 4.1: A deployment architecture for SSO and web service call.

1597

The above diagram illustrates a typical frontend-backend integration situation.

1598

The TAS<sup>3</sup> integration can be accomplished in several ways, from least intrusive to the original (legacy) application to more intrusive, but also more granular:

1599

1600

**Proxy or mediation box approach** See also [TAS3D71IdMAnAz] Fig-8.2 "Using a Gateway for Legacy Applications". This approach is completely application independent and simply TAS<sup>3</sup> wraps existing protocol. Limitation tends to be that TAS<sup>3</sup> authorization and obligations have to be applied at granularity of a protocol message rather than the data in it.

1601

1602

1603

1604

**Application server filter approach** Either web server module, like mod\_auth\_saml, or an application server module, like Servlet Filter or AXIS2 Interceptor, is inserted to the processing stack. While software realization is quite different, this is still similar to the mediation box model.

1605

1606

1607

**Application class dependent filter approach** Similar to the above filter approach, but the filter has some ability to "drill in" to the application protocol. For example, if all data in the application is represented in uniform format, such as Java Objects, then a generic filter can be supplied that applies authorization and obligations to all data represented in such way.

1608

1609

1610

1611

**API approach** This approach relies the application programmer to instrument his application with necessary authorization and other calls. We are simply trying to make his job easier by providing readily available, TAS<sup>3</sup> certified, APIs that make the instrumenting job easy.

1612

1613

1614

1615

### 4.1 Frontend and Web Services Client Integration Model (Non-normative)

1616

The tasks to be accomplished on the Frontend, in the direct line of call, include

1617

1. Detect need for login (done by payload servlet)

- 1618 2. Perform SSO (SP side)
- 1619 3. Perform SSO, IdP side including authenticating user and shipping attributes
- 1620 4. Gater additional attributes, if needed ("Attr")
- 1621 5. Authorize access to FE (PEP-Rs-In of FE) ("PEP")
- 1622 6. Populate session of the payload servlet ("ses")
- 1623 7. Redirect user to protected resource he was trying to access on the protected resource.
- 1624 8. Application dependent PEP calls PDP if needed. ("PEP")
- 1625 9. Call web service, including
  - 1626 a. Application dependent processing steps ("etc")
  - 1627 b. Authorize the call (PEP-Rq-Out) ("PEP")
  - 1628 c. Discover suitable service, performing Trust and Privacy Negotiation (may need interaction at front-end web gui) if needed. ("DIC")
  - 1629 d. Decorate request with TAS3 specific SOAP headers and sign. ("WSC")
- 1631 10. Perform network I/O ("HTTP"). This also includes TLS certificate authentication of the Responder and may include Client-TLS certificate authentication of the Requester.

1633 The SSO integration is expected to be a single module, appearing as a servlet in Java realization and as an authentication module in web server realization, that handles steps 2-7 automatically. The integration is accomplished by configuring the web server without modifying the application except to add the initial detection and redirect (1) and to make use of the attributes that were populated to the session.<sup>1</sup> The TAS<sup>3</sup> binary modules for SSO are generically called T3-SSO-\*

1638 The WSC integration is expected to be a single module. It will appear as AXIS2 module in Java realization so that it can be just hooked in by configuration without any modification to the existing web service (the "etc" module illustrates that even other modules than TAS<sup>3</sup> can be hooked in without interference<sup>2</sup>).

1641 The API realization of WSC is a function, *tas3\_call()* (see TAS<sup>3</sup> API), that the application can call directly. If this approach is chosen, the entire web services call is handled by the API without any regard to servlet environment's or framework's hooking or modules. This is the most common approach in PHP, Perl, C#, C++, and C worlds.

1645 A possible variant of WSC integration is to call *tas3\_call\_prepare()* to obtain the serialized SOAP envelope, then do the I/O part in application dependent way, and pass the response to *tas3\_response\_validate()*. Effectively *tas3\_call()* does these steps with a built-in HTTP client performing the I/O part.<sup>3</sup>

#### 1649 4.1.1 Integration Using ZXID (Non-normative)

1650 Further information about using ZXID for TAS<sup>3</sup> is available in README.zxid-tas3, zxid-tas3.pd, and zxid-java.pd

1652 The official TAS<sup>3</sup> API is provided by *tas3.h* which maps the TAS<sup>3</sup> API definitions to the underlying zxid ones.

1654 The Java realization of SSO is provided by *zxidservlet* class and *servlet*. This is packaged as TAS<sup>3</sup> binary module T3-SSO-ZXID-JAVA.

1656 The web server realization of SSO is provided by *mod\_auth\_saml* Apache module (*mod\_auth\_saml.so*). It is packaged as TAS<sup>3</sup> binary module T3-SSO-ZXID-MODAUTHSAML.

<sup>1</sup>In *mod\_auth\_saml* realization even step (1) can be accomplished by configuring the web server.

<sup>2</sup>Non-interference depends on other modules following certain common sense conventions, such as not signing SOAP <e:Headers> element and not trying to create SOAP headers that TAS3 creates (e.g. <wsse:Security>).

<sup>3</sup>In ZXID realization the HTTP client is libcurl from curl.haxx.se

Figure 4.2: API and modules for SSO and web service call.

Figure 4.3: ZXID specific API and modules for SSO and web service call.

1658 API realization of SSO is provided by *zxid\_simple()* in *libzxid.a*. This is packaged as TAS<sup>3</sup> binary  
 1659 module T3-SSO-ZXID-PHP.<sup>4</sup> Other language binding specific modules are expected in the future.

<sup>4</sup>Although not TAS3 packaged, Net::SAML perl module provides the same functionality.

1660

1661 **4.1.2 Integration Using Other Platforms, Frameworks, and Packages (Non-**  
 1662 **normative)**

1663 Other mainstream packages are invited to submit integration descriptions similar to previous section  
 1664 (ZXID). The details of the integration should be in package's own documentation.

1666 **4.2 Web Services Provider Integration Model (Non-normative)**

1667 The tasks to be accomplished on the Service Responder, in the direct line of call, include

- 1668 A. Listen for HTTP requests (typically done by platform)
- 1669 B. Parse and validate a web services request, e.g. call *tas3\_wsp\_validate()*. This involves checking for  
 1670 valid signature from trusted authority.
- 1671 C. Authorize the request, extracting from the request the pledges (in `<b:UsageDirective>`) ("PEP-Rs-  
 1672 In").
- 1673 D. Apply other filters and post processing steps ("etc")
- 1674 E. Authorize each data item separately using input interceptor. For queries this is usually a no-op, but for  
 1675 creates or updates this is meaningful. When data is accepted for the repository, the authorization step  
 1676 can result in obligations or sticky-policies being written into the database along side the data itself.  
 1677 The authorization is configurable according to Application Independent PEP configuration, described  
 1678 elsewhere, or Application Dependent PEP approach can be taken, calling the PDP directly ("PEP").
- 1679 F. Authorize each returned data item separately using input interceptor. Usually applicable to query  
 1680 results. The per item authorization will apply systemwide and item specific policies (sticky policies)  
 1681 and obligations and produce a deny or permit-with-obligations response.  
 1682 The authorization is configurable according to Application Independent PEP configuration, described  
 1683 elsewhere, or Application Dependent PEP approach can be taken, calling the PDP directly ("PEP").
- 1684 G. Authorize the response in aggregate ("PEP-Rs-Out"). At this stage one of the most important veri-  
 1685 fications is to compare the pledges collected in step C ("PEP-Rs-In") and filter out any data whose  
 1686 obligations are stricter.

1687 **Optimization.** It is possible to combine the pledges to obligations matching (in G) to the  
 1688 per result item authorization (F) by simply feeding the pledges as inputs to the PDP in (F).  
 1689 Such optimization can not, however, achieve all functionality of the G ("PEP-Rs-Out") as it  
 1690 is unable to see the bigger picture, i.e. consider all data together as a set. A typical example  
 1691 would be a rule against leaking simultaneously day and month of birth and year of birth.

1692 H. Decorate the response with TAS<sup>3</sup> specific SOAP headers. This is typically done by calling *tas3\_wsp\_decorate()*.

1693 I. Send the response. This is typically done by platform dependent means.

1694

## 5 Resilient Deployment Architecture (Non-normative)

1696 This section addresses Req. *DI.2-2.8-Avail*.

1697 For TAS<sup>3</sup> services to be dependable, they need to be deployed so that they are resilient to system and  
 1698 network failure. Resiliency and efficiency are the first lines of defense against Denial of Service attacks  
 1699 that try to attack simple catastrophic vulnerabilities or overwhelm the system on the point where it is most  
 1700 inefficient. Resiliency needs to be considered at several layers, namely on the Front Channel and on the  
 1701 Back Channel.

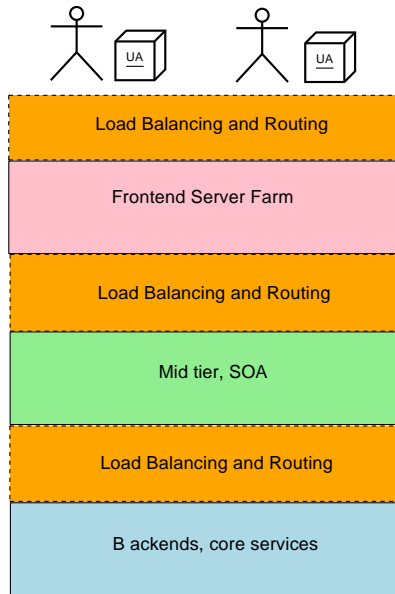

Figure 5.1: Layering of resilience features for Front Channel, Back Channel, and data center Back End services.

Figure 5.2: Resiliency implemented using hardware load balancers.

1702 Note that the virtual IP address is hosted either in hardware load balancer, or one member of a cluster.  
 1703 Fail-over of the virtual IP is arranged using Virtual Router Redundancy Protocol (VRRP) [RFC3768].

Figure 5.3: Resiliency implemented using software load-balancing-fail-over functionality and clustering.

1704

## 1705 5.1 Zero Downtime Updates

1706 This section addresses Req. *D1.2-7.19-DynaUpd*.

1707 For continued availability of the system, Zero-Downtime-Update (ZDTU) technology SHOULD be  
 1708 implemented through out. If horizontal scaling path and failure recovery have been implemented, then  
 1709 ZDTU can be implemented easily by taking out of farm one server at a time and updating it. Downside of  
 1710 this approach is that the farm will temporarily be in an inconsistent state.

1711 If consistency of the farm is at all times a requirement, no easy ZDTU approach exists. One approach  
 1712 is to bring up new "hot standbys" along side of the old configuration and then do instantaneous switch. As  
 1713 the switch over is less than 1 second, this could be considered ZDTU.

1714 Never-the-less, as TAS<sup>3</sup> is business process driven and as business processes can take long time to  
 1715 complete (if human interaction is required, this could easily mean days or weeks), thus consistent ZDTU  
 1716 is infeasible in practise and the business process modelling should explicitly foresee handling of upgrade  
 1717 situations, i.e. how old processes are handled after the general upgrade.

1718

1719

## 6 Feasibility and Performance Analysis (Non-normative)

1720

1721

TAS<sup>3</sup> Architecture is rather complex so we need to analyze the runtime cost of implementing it. The cost can be divided in six categories

1722

1723

1724

1725

1726

1727

1728

1729

1730

1731

1732

**T** Connection overhead, including TCP handshake and TLS handshake. The latter involves one public key operation on both sides, unless TLS connection cache hit is achieved. Except for the cache hit case, connection overhead is mostly unavoidable given TAS<sup>3</sup> Architecture's division of components. Sometimes co-locating several components in same host may allow use of localhost connection to avoid handshake overhead. The TLS overhead may be avoidable in localhost and secure internal network cases. The TCP overhead is very sensitive to latency: usually a precondition for a connection is to resolve a domain name: this means one round trip latency cost. Then actual threeway TCP handshake needs to be performed, causing three round trip latencies. Finally TLS handshake causes at least one more round trip. Therefore the time cost of a connection tends to be minimum of 5 round trip latencies. Higher the latency, more time it takes to process a call and more simultaneous calls are needed to keep up the same through put.

1733

1734

1735

1736

**C** Communication overhead: this consists of compression, encryption (symmetric stream cipher), and transfer of the actual data. Mostly unavoidable. As communication cost and stream cipher tend to be negligible compared to TCP + TLS handshake and digital signatures, we will not consider communication cost in our calculations.

1737

1738

1739

1740

**S** Digital signature overhead: usually at least one public key operation is involved on each side. Often responder side needs to verify several digital signatures: one for the message and one for each token or credential it receives. The signature overhead is mostly unavoidable, though some caching and session techniques may reduce it in case of often repeated actions.

1741

1742

1743

1744

1745

1746

**X** XML overhead: the arcane and poorly designed features, such as namespaces and canonicalization, of XML cause significant processing overhead (not to mention bugs). In some Java implementations of digital signature processing the XML formatting consumes as much CPU as the public key operation. Even in the best of breed implementations XML formatting has significant cost, usually about 20% of the cost of a public key operation. XML cost could be eliminated by choosing a more rational data format.

1747

1748

1749

1750

**Z** Authorization cost. Evaluation of rule set will depend heavily on the particular ruleset and its implementation technology. Some rulesets are known to take exponential time to evaluate. Authorization cost is exclusively borne by the PDP components. While a PDP may incur additional cost in validating credentials, this is not taken in account here (but can be accounted as digital signature overhead).

1751

1752

**P** Payload cost. This is the cost of running the actual application and is unavoidable. Since we are trying to measure the overhead cost of TAS<sup>3</sup> Architecture, the payload is assumed to be free.

1753

1754

1755

1756

1757

1758

1759

1760

In cost calculations we will use units with overall cost computed as show in following table:

The cost is unevenly divided among the entities in the TAS<sup>3</sup> trust network, but the division depends heavily on whether caching can be utilized. If the usage pattern is isolated single operations, the IdP, discovery, and credential issuance tend to become hotspots because these functions are relied on by many other players in the network. For single operations the TLS cache misses will penalize the system overall.

If the usage pattern is repeat operations, then the bottleneck tends to shift towards responder processing: credentials can be cached, but they still need to be validated every time (some checksum based validation cache may be feasible, but has not been explored yet).

1761

1762

1763

1764

Overall bottlenecks in both cases include audit bus logging, local audit trail (especially if digitally signed), and authorization. In this analysis audit bus is assumed to work by exchanging digitally signed SOAP messages and each exchange to be authorized separately.

To explore the cost we will consider two scenarios.

Table 6.1: Units of cost computation and their RSA equivalence

Unit	RSA Eq.	Definition
T	1.5	One TLS connection establishment. Not entirely RSA comparable as latency component is involved.
t	0.5	One TLS connection establishment, with connection cache hit (avoids public key operation)
S	1	One digital signature generation or validation
X	1	One XML document parse or canonicalization
Z	0.5	One ruleset evaluation.

1765

## 1766 6.1 Single use of single web service

1767 This scenario consists of user making Single Sign-On to a frontend and invoking an operation that  
1768 requires calling a web service. The sequence of events and the cost is indicated in the table.

1769 Table 6.1: Cost of TAS<sup>3</sup> single use scenario

Operation	IdP + Disc.	Frontend	FE PDP	Responder	Rs PDP	Audit Bus	Audit Bus PDP
1. SSO	$2T+4S+4X=11$	$4T+3S+5X=14$	$2T+2S+3X+Z=8.5$			$4(2T+S+3X)=28$	$4(T+2X+Z)=16$
2. Discovery	$2T+3S+3X=9$	$T+S+X=3.5$				$2T+S+3X=7$	$t+2X+Z=2.5$
3. Trust & Priv.	$T+2X=3.5$				$2T+S+3X=7$	$2T+S+3X=7$	$t+2X+Z=2.5$
4. Rq Out PEP		$t+2X=2$	$2t+2S+4X+1Z=6.5$			$2t+S+3X=4$	$t+2X+Z=2.5$
5. Send request		$2T+2S+2X=7$		$2T+3S+3X=9$		$2(2t+S+3X)=8$	$2(t+2X+Z)=5$
6. Rs In PEP				$t+2X=2$	$2t+2S+4X+Z=6.5$	$2t+S+3X=4$	$t+2X+Z=2.5$
7. Payload							
8. Rs Out PEP				$t+2X=2$	$2t+2S+4X+Z=6.5$	$2t+S+3X=4$	$t+2X+Z=2.5$
9. Send response		$t+2S+2X=4$		$t+2S+2X=4$		$2(2t+S+3X)=8$	$2(t+2X+Z)=5$
10. Rq In PEP		$t+2X=2$	$2t+2S+4X+Z=6.5$			$2t+S+3X=4$	$t+2X+Z=2.5$
11. Process Oblig		$2t+S+2X=3$		$2t+S+2X=3$		$2(2t+S+3X)=8$	$2(t+2X+Z)=5$
12. SLO	$2t+2S+3X=5$	$2t+2S+3X=5$				$2(2t+S+3X)=8$	$2(t+2X+Z)=5$
1770 TOTAL	$5T+9S+12X=28$	$5T+11S+19X=40$	$52T+6S+11X+3Z=21$	$5T+6S+11X=20$	$2T+5S+11X+2Z=20$	$12T+18S+54X=90$	$4T+36X+18Z=51$

1771 The grand total is  $34T+55S+154X+23Z=271.5$  RSA operation equivalents.

1772 For a fair comparison, a simple web service call without any authorization or auditing, using HTTP  
1773 Basic authentication and TLS, the cost is shown in the following table. The total cost of such unsecure  
1774 call is estimated as 8.5 RSA operation equivalents. The cost of a fully secure platform appears to be about  
1775 31 times that of unsecure platform.

1776 Table 6.2: Cost of unsecure single use scenario

Operation	Frontend	Responder
1. Login	$T=1.5$	
5. Send request	$T+X=2.5$	$T+X=2.5$
7. Payload		0
9. Send response	$X=1$	$X=1$
1777 TOTAL	$2T+S+2X=5$	$1T+S+2X=3.5$

1778

1779 **6.1.1 Cost without auditing**

1780 Above calculation shows that the Audit Bus substantially adds to the cost. Here's the same calculation  
1781 without Audit Bus.

1782 Table 6.3: Cost of TAS<sup>3</sup> single use scenario without auditing

Operation	IdP + Disc.	Frontend	FE PDP	Responder	Rs PDP
1. SSO	1T+2S+2X=5.5	3T+2S+4X=10.5	T+S+2X+Z=5		
2. Discovery	1T+2S+2X=5.5	T+S+X=3.5			
3. Trust & Priv.	T+2X=3.5				T+2X=3.5
4. Rq Out PEP		T+2X=3.5	1T+1S+3X+1Z=6		
5. Send request		1T+1S+1X=3.5		1T+2S+1X=4.5	
6. Rs In PEP				T+2X=3.5	1T+1S+3X+1Z=6
7. Payload				0	
8. Rs Out PEP				T+2X=3.5	1T+1S+3X+1Z=6
9. Send response		S+X=2		S+X=2	
10. Rq In PEP		T+2X=3.5	T+S+3X+Z=6		
11. Process Obli		T+X=2.5		T+X=2.5	
12. SLO	T+S+2X=4.5	T+S+2X=4.5			
TOTAL	4T+5S+8X=19	9T+6S+14X=33.5	3T+3S+8X+3Z=17	4T+3S+7X=16	3T+2S+8X+2Z=15.5

1783

1784 The grand total without auditing is 23T+19S+45X+5Z=101 RSA operation equivalents. As can be  
1785 seen, the Audit Bus represents 63% of the total cost. Most of the Audit Bus cost is actually caused by  
1786 requirement to contact the bus and authorize the sending of messages. A future revision of the architecture  
1787 will explore the possibility of persistent connection to the Audit Bus. This would significantly reduce the  
1788 T, t, S, and Z aspects of the Audit Bus processing, though at least one signature overhead will be needed  
1789 at the message source to ensure untamperability of the audit trail.

1790 Another optimization would be to improve the authorization step of the Audit Bus, perhaps co-locating  
1791 the Audit Bus PDP with the Audit Bus itself.

1793 **6.1.2 Cost without auditing and without authorization**

1794 Another recurring activity are the frequent calls to the PDPs. Following table explores how much could  
1795 be saved by optimising these calls.

1796 Table 6.4: Cost of TAS<sup>3</sup> single use scenario without auditing and without authorization

Operation	IdP + Disc.	Frontend	Responder
1. SSO	1T+2S+2X=5.5	3T+2S+4X=10.5	
2. Discovery	1T+2S+2X=5.5	T+S+X=3.5	
5. Send request		1T+1S+1X=3.5	1T+2S+1X=4.5
7. Payload			
9. Send response		S+X=2	S+X=2
11. Process Oblig		T+X=2.5	T+X=2.5
12. SLO	T+S+2X=4.5	T+S+2X=4.5	
TOTAL	3T+5S+6X=15.5	7T+6S+10X=26.5	2T+3S+3X=9

1797

1798 The grand total without audit and without authorization is 12T+14S+19X+0Z=51 RSA operation equiv-  
1799 alents. The authorization steps (excluding Audit Bus related authorization) seem to be adding about as  
1800 much over head as the entire rest of the web service call.

1801 The bare ID-WSF 2.0 web service call compares relatively favorably with bare unsecure web service  
1802 call: 51 vs. 8.5 - only 6 times heavier.

1803

1804 **6.1.3 Cost without XML**

1805 Since XML processing is needlessly expensive, lets analyze what the cost could be with non-XML  
 1806 protocols like RESTful approach using Simple Web Tokens [Hardt09].

1807 Table 6.5: Cost of TAS<sup>3</sup> single use scenario without XML

Operation	IdP + Disc	Frontend	FE PDP	Responder	Rs PDP	Audit Bus	Audit Bus PDP
1. SSO	2T+4S=7	4T+3S=9	2T+2S+Z=5.5			4(2T+S)=16	4(T+Z)=8
2. Discovery	2T+3S=6	T+S=2.5				2T+S=4	T+Z=2
3. Trust & Priv.	T=1.5				2T+S=4	2T+S=4	T+Z=2
4. Rq Out PEP		T=1.5	2T+2S+Z=5.5			2T+S=4	T+Z=2
5. Send request		2T+2S=5		2T+3S=6		2(2T+S)=8	2(T+Z)=4
6. Rs In PEP				T=1.5	2T+2S+Z=5.5	2T+S=4	T+Z=2
7. Payload							
8. Rs Out PEP				T=1.5	2T+2S+Z=5.5	2T+S=4	T+Z=2
9. Send response		T+2S=3.5		T+2S=3.5		2(2T+S)=8	2(T+Z)=4
10. Rq In PEP		T=1.5	2T+2S+Z=5.5			2T+S=4	T+Z=2
11. Process Obli		2T+S=4		2T+S=4		2(2T+S)=8	2(T+Z)=4
12. SLO	2T+2S=5	2T+2S=5				2(2T+S)=8	2(T+Z)=4
1808 TOTAL	7T+9S=19.5	14T+11S=32	6T+6S+3Z=16.5	7T+6S=16.5	6T+5S+2Z=15	36T+18S=72	18T+S+X+18Z=36

1809 Without the XML, but otherwise fully featureful architecture leads to grand total of 94T+55S+0X+23Z=207.5  
 1810 RSA equivalents. Thus eliminating XML can lead to over 40% of savings.

1812 **6.2 Session of 3 frontends and five web services**

1813 This session is meant to illustrate the types of savings available from caching discovery results.

1814 The three frontends are all accessed in the same single sign-on session, leading to savings at IdP. Each  
 1815 frontend then calls two web services. One (A) is common, shared web service. Other (B) is new web  
 1816 service (new for each frontend), but the service is called 4 times, which leads to EPR cache hits. The  
 1817 pattern also encourages TLS cache hits. We also assume repeated calls to PDP and audit bus lead to TLS  
 1818 cache hits.

1829

This sequence of 15 web service calls has grand total of  $116T+522S+1531X+239Z=2346.5$  RSA equivalents, which works out to about 156 RSA equivalents per web service call. As can be seen the cache effects and amortization of the SSO and discovery over several calls makes a significant impact. The amortized cost is 58% of the single call cost. Effectively the amortized calls are 18 times heavier than plain web service calls.

```

2032 N.B. The AttributeStatement/Attribute/AttributeValue/EndpointReference/Metadata/ SecurityContext  
2033 is the same as the IdP because in many products the IdP and Discovery Service roles are implemented by  
2034 the same entity. Note also that the audience of the inner assertion is the discovery service where as the  
2035 audience of the outer assertion is the SP that will eventually call the Discovery Service.

## 2037 7.2 ID-WSF 2.0 Call with X509v3 Sec Mech

2070 </e:Header>
2071 <e:Body wsu:Id="BDY">
  <xx:Query/></></>

```

2072 The salient features of the above XML blob are

- 2073 • Signature that covers relevant SOAP headers and Body
- 2074 • Absence of any explicit identity token.

2075 Absence of identity token means that from the headers it is not possible to identify the target identity.  
 2076 The signature generally covers the Invoker identity (the WSC that is calling the service). Since one WSC  
 2077 typically serves many principals, knowing which principal is impossible. For this reason X509 security  
 2078 mechanism is seldom used in ID-WSF 2.0 world (with ID-WSF 1.1 the ResourceID provides an alternative  
 2079 way of identifying the principal, thus making X509 a viable option).

### 2081 7.3 ID-WSF 2.0 Call with Bearer (Binary) Sec Mech
